INTRODUCTION

Muscle removed 'hot' from the carcass has greater water binding capacity (WBC) than that removed post-rigor and is excellent and the carcass has greater water binding capacity (WBC) than that removed post-rigor (MBC) the the carcass has greater water binding capacity (WBC) than that removed post-rigor and is excellent and the carcass has greater water binding capacity (WBC) than that removed post-rigor (MBC) the the carcass has greater water binding capacity (WBC) than that removed post-rigor (MBC) the carcass has greater water binding capacity (WBC) than that removed post-rigor (MBC) the the carcass has greater water binding capacity (WBC) than that removed post-rigor (MBC) the carcass has greater water binding capacity (WBC) than that removed post-rigor (MBC) the the carcass has greater water binding capacity (WBC) than that removed post-rigor (MBC) the carcass has greater water binding capacity (WBC) than that removed post-rigor (MBC) the carcass has greater water binding capacity (WBC) the carcass has greater and is excellent raw material for sausage manufacture (Hamm, 1972). Recent studies (Jolley, Honikel & Hamm, if done as soon as possible past slaughter: nevertheless, a marked benefit from salt is still achieved right If "ul, "ellent raw material for sausage manufacture (nomm, trip, which honikel et al, 1981a & b) have shown that improvement in WBC by chopping with salt is most ellective to to as soon as possible post slaughter; nevertheless, a marked benefit from salt is still achieved right of rigor.

^{Muset} of rigor. ^{Concentration} Meat products have a range of salt ^{Concentrations} studies standardised on a 2% salt concentration. Meat products have a range of salt ^{Concentrations} successful traditionally with their manufacture, often below 2%. Before the use of pre rigor ^{ves}e ^{Garlier} studies standardised on a 2% salt concentration. Meat products have a range of sale ^{barrient}rations associated traditionally with their manufacture, often below 2%. Before the use of pre rigor ^{and} whether products can be recommended, it is necessary to know the effect of lower levels of salt on WBC, ^{barrient} this officient chapters with increasing delay between slaughter and manufacture. The present work Much Products can be set with set of the set whether this effect changes with increasing delay between slaughter and manufacture. The present work ribes an investigation of these fectors MATERIALS AND METHODS

^{MALS} AND METHODS ^{Annumber} ^{muscles} (mainly <u>M. sternomandibularis</u> and <u>M. sternomastoideus</u>) were obtained within 40 min of ^{Annumber} from either a local abattoir or the abattoir of the Meat Research Institute, U.K. The muscles were ^{Annumber} tage 90-200g. Sufficient material was taken for immediate sampling (time 0) and the remaining slices ^{Annumber} and connective tissue and then divided longitudinally into slices 1-2 cm thick and in the ^{Andumber} tage 90-200g. Sufficient material was taken for immediate sampling (time 0) and the remaining slices ^{Andumber} marked, slight, and no cold shortening respectively (Bendall, 1973), so that interactive effects of ^{Mod}uce ^{Macked} in individual polypropylene pouches and placed in a cryostat bath at +0.5°C, /°, or 14 c, to ^{Macked} in individual polypropylene pouches and placed in a cryostat bath at +0.5°C, /°, or 14 c, to ^{Macked} is slight, and no cold shortening respectively (Bendall, 1973), so that interactive effects of ^{Mached} and salt concentration could be checked.

^{tere} length and salt concentration could be checked. ^{length} and salt concentration could be checked. ^{length} selected packs were removed at two further sampling times chosen to correspond approximately to two ^{length} selected packs were removed at two further sampling times chosen to correspond approximately to two ^{length} selected packs were removed at two further sampling times chosen to correspond approximately to two ^{length} selected packs were removed at two further sampling times chosen to correspond approximately to two ^{length} selected packs were removed at two further sampling times chosen to correspond approximately to two ^{length} selected packs were removed at two further sampling times chosen to correspond approximately to two ^{length} selected packs were removed at two further sampling times chosen to correspond approximately to two ^{length} selected packs were removed at two further sampling times chosen to correspond approximately to two ^{length} selected packs were removed at two further sampling times chosen to correspond approximately to two ^{length} selected packs were removed at two further sampling times chosen to correspond approximately to two ^{length} selected packs were removed at two further sampling times chosen to correspond approximately selected packs were removed at two further sampling times chosen to correspond approximately selected packs were removed at two further sampling times chosen to correspond approximately selected packs were removed at two further sampling times chosen to correspond approximately selected packs were removed at two further sampling times chosen to correspond approximately selected packs were removed at two further sampling times chosen to correspond to cor ^{PD}rtant events in the pattern of ATP hydrolysis post rigor as described by Bendall, 1975. The table of the events in the pattern of ATP hydrolysis of ATP is no longer sufficient to equal its the pattern of the ATP delay phase when resynthesis of ATP is no longer sufficient value. Similarly, the 2 is, and provide the end of the ATP delay phase to fall from its previously constant value. Phoximate events in the pattern of ATP hydrolysis post right as the second state of the pattern of ATP hydrolysis post right as the second second state of the pattern of ATP hydrolysis post right as the second se

Preparation of salted muscle homogenates

Allon of salted muscle homogenates Wiscle ^{strips} were minced once through a plate with 4.5 mm holes and weighed. This was repeated with maker of the packs from the envectet bath until there was sufficient bulk mince to produce the appropriate amounts of Muscle "homogenates" were produced by the method of Jolley <u>et al</u> (1900-017), Muscle strips were minced once through a plate with 4.5 mm holes and weighed. This was repeated with appropriate amounts of Muscle strips were minced once through a plate was mixed by hand and 66g samples mixed with appropriate amounts of the bulk mince was mixed by hand and 66g samples mixed, and chopped four times for the bulk mince was mixed by hand and 66g samples mixed, and chopped four times for the bulk mince was mixed by hand and 66g samples mixed with appropriate amounts of the bulk mince was mixed by hand and 66g samples mixed with appropriate amounts of the bulk mince was mixed by hand and and 66g samples mixed with appropriate amounts of the bulk mince was mixed by hand and 66g samples mixed with appropriate amounts of the bulk mince was mixed by hand and 66g samples mixed with appropriate amounts of the bulk mince was mixed by hand and 66g samples mixed with appropriate amounts of the bulk mince was mixed by hand and 66g samples mixed with appropriate amounts of the bulk mince was mixed by hand and 66g sample number of salt. Fi It of Packs from the cryostat bath until there was sufficient bulk mince to produce the appropriate amounts of homogenates. The bulk mince was mixed by hand and 66g samples mixed with appropriate amounts of seconds in a "Moulinette" (Moulinex, France) chopper. The term "homogenate" is used for convenience, we meant to imply a perfectly homogeneous entity either chemically or histologically.

Determination of pH

The the early experiments of this study, pH was determined immediately after homogenising 3-5 days of muscle with an approximately occur, amount of double distilled water. This was later replaced by homogenising lg the of the of the of the occur, amount of double distilled water. This was later replaced by homogenising later states of the occur, amount of double distilled water. This was later replaced by homogenising later states of the occur, amount of double distilled water. This was later replaced by homogenising later states of the occur, amount of double distilled water. This was later replaced by homogenising later states of the occur, and the occur, amount of double distilled water. Mith early experiments of this study, pH was determined immediately after homogenising 3-5 days of muscle study of mines approximately equal amount of double distilled water. This was later replaced by homogenising lg detroide the the the study of mines in 10 ml 150mMKCl/5mM iodoacetic acid (pH 7.0) using a laboratory mixer emulsifier (Silverson homotoge (Russell pH Ltd). These methods of determination produce similar results, but the latter procedure a sample of stable of Rechines Ltd) and determine Rectrode (Russell pH Ltd). Roduces a consta of stable p Noduces a Sample of stable pH.

Mater binding capacity

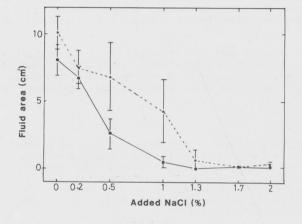

Ounding capacity he was determined on 0.3g of each homogenate by the filter paper press method of Grau and Hamm (1952, and is reported as area of expressed fluid.

Central also according to the second also horted as area of expressed fluid. Also hold water during heating and subsequent hugation. Retwork 2 for horecapite was accurately weighed into 15 ml glass tubes which were stoppered by more accurately weighed into 15 ml glass tubes which were stoppered Min 'If use assessed on all samples by the ability of homogenates to hold water during heating and subsequent dia gassion. Between 2-5g homogenate was accurately weighed into 15 ml glass tubes which were stoppered for 15 minutes and placed in a boiling water bath for 15 minutes. Fluid released on heating was weight to sample lightly dried on tissue paper. The heated samples were then centrifuged at 15000 rpm weight loss is expressed as a percentage of the initial sample weight. The formation of the sample lightly dried on tissue paper. The trans-internal Weight loss is expressed as a percentage of the initial sample weight.

RESULTS

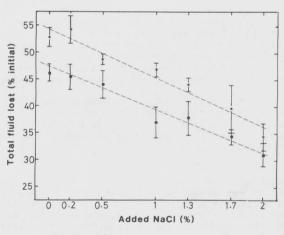

There was no marked effect of holding temperature on WBC, in agreement with our earlier results (Jolley et al. 1981b). In the sharper of out a Science of out a start with our earlier results (Jolley et al. Honikel et al, 1981b). In the absence of such effect, results at any one salt concentration have ned at each of the sampling times. been combined at each of the sampling times.

Figure 1 shows the relationship between area of expressed fluid and salt concentration in all homogeneter and time 0 and time 2. Little or no fluid was expressed from homogeneter meter with 1.3% salt as prepared at time 0 and time 2. Little or no fluid was expressed from homogenates made with 1.3% salt 3, the area of expressed from homogenates made with 1.3% salt 3, from 1.3% frequently appeared linear but there was considerable variation in the pattern. This is reflected by

The relationship between total fluid losses on heating and subsequent centrifugation and salt concentration between the two factors of all since in Figure 2. There was a highly significant (2 and salt concentration) There was a highly significant (P<0.001) linear correlation between the two factors at all sampling times.

<u>Fiqure 2</u>. Effect of differing salt concentrations on total fluid loss on heating and subsequent production, expressed as percent initial weight of sample. Broken lines on heating and subsequent production by lines of the product of the produc

Both Figures 1 & 2 show that the WBC of homogenates produced at time 2 was not as good as those $p_{time}^{rodvced}$, generally intermediate between those shown for the other sampling times.

DISCUSSION

and ionic Three factors are known to be important in explaining the superior WBC of pre-rigor meat: ATP, pH, and is a strength (Hamm, 1972). The major role of ATP in this context is probably to permit the spatial separation actin and myosin without the hindrances imposed by cross links (Jolley et al, 1980-81 : Honikel et al, of our This separation can presumably occur regardless of sarcomere length in a way analogous to the relaxing of shortened muscle when transferred to 20°C before rigor onset (Bendall, 1973).

PH at each sampling time. Sample time
