MEAT AND PROTEIN ADDITIVES : AMINO ACID AND MINERAL COMPOSITION

Z. Šimkevičienė, D. Kažemėkaitytė, R. Masteikienė
Kaunas University of Technology
Lithuania

The research was undertaken to examine the amino acid mineral composition of protein additives used in Lithuania meat industry and evaluate their influence as meat substitutes. Soy concentrate and isolate, sunflower concentrate, sodium caseinate, whey protein concentrate, skimmed milk and buttermilk power, dry lightened blood and dry protein concentrate (50 % blood and 50 % skimmed milk) were analyzed on their amino acid and mineral (Na, K, Ca, Mg, Fe, Zn, Cu, Mn) composition. The pork meat was examined as the reference pattern.

Calculations of the influence of 5 % dash of any mentioned protein additive to amino acid and mineral composition of model meat product revealed the varieties in selected nutrients content depending on the used additive.

Solitary non meat protein additives affect the common meat amino acid and mineral composition. Therefore, the proper selections of meat substitution (especially in dietetic products) require higher accuracy and, on the other hand, well- founded protein mixtures would be far superior to the single protein additive.

• *INTRODUCTION*

Today's consumers want not only products that are convenient and taste good, they also concerned about nutritional value. Non meat protein additives are widely used in meat industry due to their technological, nutritional properties and economy. Each protein, according it's origin, methods of isolation and manufacturing, has unique composition that does or would make that protein can enhance the nutritional properties of the food it is added to [1 - 3] and all daily allowances, also.

The protein additives are used as meat substitutes and there is an important to keep the same level of nutrients which is in meat.

Amino acid composition is mostly used as criteria to asses protein nutrition [4,7]. Since each product together with proteins contains other biological necessary constituents (lipids, carbohydrates, minerals), one of them - minerals -were investigated and analyses on their potential influence on common meat product composition was made, also. The aims of the present study were :

1. Investigate chemical, amino acid and mineral composition of protein additives most commonly used in Lithuania.
2. Calculate possible changes in meat microsubstances due protein additives' employment.
3. Select the best meat substitute according the nutritional value.

• *OBJECTS*

Dry protein additives collected from Lithuania food industry:

- SI - soy isolate Purina 500 E- made in USA,
- SK - soy concentrate Danpro H- made in Denmark,
- SB - sunflower protein- made in Ukraine,
- NK - sodium caseinate -made in Estonia,
- IBK - whey protein concentrate - made in Estonia,
- SP - butter milk - made in Lithuania,
- SNP - skimmed milk - made in Lithuania,

- SNK - dry lightened blood (by using of hydrogen peroxide) - made in Lithuania,
- SBM - dry protein mixture (1 part of lightened blood and 1 part of skimmed milk) - made in Lithuania.

Base on facts that:

- meat has high biological value with good balance of amino acids and almost full complex of essential minerals for human vitally activity,
- science progress changes criteria of nutritional value (FAO/WHO,1973, FAO/WHO/UNU,1984),
- there is is no agreement about necessary in balance of all nutrients in one product

in our research lean pork meat was used as the reference pattern.

- *PROCEDURE*

Proximate composition of these proteins was determined by following procedures:
moisture - drying at 105° C in an oven for 24 h,
ash - mineralization at 550° C,
crude protein - calculated by multiplying the percent nitrogen obtained by half micro Kjeldhal method with the factor 6.25,
crude fat - by Soxhlet extraction with chloroform,
amino acid analyses - on an amino acid analyzer (model T339, Czech), following hydrolyze with 6 N HCl at 110° C for 24 h.
trypthopane - photocolorimetric method (with paradimethilbenzaldehide) following alkaline hydrolyze with 2,5 NaCl at 114° C for 4 h. Photoelectric colorimeter FEK - 60 - Y.42 (Russia),
mineral composition - spectra emission photographic method. Spectrograph ISP - 28 (Russia),
Ca, Mg, Fe, Zn, Cu, Mn - atomic absorption spectrophotometer (model Perkin - Elmer), following mineralization with perchloric acid,
Na, K - after mineralization with perchloric acid with spectrophotometer PFM (Hungary),
P - photocolorimetric method (with ammonia molibdate). Photoelectric colorimeter FEK - 60 - Y.42 (Russia).

All determinations were performed triplicate.

Calculation of the influence of dash of protein additive to amino acid and mineral composition of model meat product was made according formula:

$$\Delta = \frac{K_{1i} - K_{0i}}{K_{0i}} = \frac{0{,}05 \cdot P_{ji} - K_{0i} \cdot \Delta m}{K_{0i}}, \%$$

$$K_{1i} = K_{0i} - K'_{0i} + P'_{ji}; \quad K'_{0i} = K_{0i} \cdot \Delta m; \quad \Delta m \ni B_j$$

K_{0i} - content of i amino acid or mineral in meat;
K_{1i} - content of i amino acid or mineral in combined product with j protein additive;
K_{1i} - content of i amino acid or mineral which is put out with replaced meat;
P_{ji} - content of i amino acid or mineral which is put in with j protein additive;
Δm - content meat which is replaced by j protein additive;
P_{ji} - content of i amino acid or mineral in j protein additive;
B_j - content protein in j protein additive.

- *RESULTS AND DISCUSSION*

1. Chemical composition of protein additives

The chemical composition of examined protein additives is given in Table 1. It was found that the protein additives contain appreciable amount of moisture (5 -9,3%) and fat (0,6 - 1.7%), but were different in ratio of macronutients. The protein content was highest for soy isolate and sodium caseinate (89,1 and 86,8%) and was lowest for whey, butter - milk and non - fat milk (16,9; 33,8 and 35,3% respectively). The ash content of these additives ranged between 3,6 and 10,1%.

Table1. Chemical composition of protein additives

	Moisture	Proteins	Lipids	Minerals	Other
SI	5,43 ± 0,21	89,06 ± 4,51	0,55 ± 0,17	3,60 ± 0,17	9,05 ± 4,07
SK	7,48 ± 0,54	65,79 ± 1,31	0,41 ± 0,10	6,01 ± 0,26	20,31 ±1,10
SB	9,30 ± 0,48	77,46 ± 1,10	1,01 ± 0,28	10,15± 1,03	2,10 ± 1,54

IBK	6,34 ± 1,02	51,42 ± 2,32	1,02 ± 0,21	4,72 ± 0,47	36,50± 2,80

Chemical composition of protein additives varies because of their nature, method's isolation and processing. For example, the high content of ash in sunflower protein currently deals with salt that is used for protein precipitating. Ultrafiltration can decrease the amount of carbohydrates and minerals.

Data of chemical composition are necessary in selecting the appropriate substitutes for several meat products in depending on their aims of use and cost. From economic point of view protein additives with high protein level such soy and sunflower proteins, lighten blood and sodium caseinate are more desirable in combined meat products. Whey protein concentrate or sodium caseinate, free of much of undesirable lactose, are more desirable products for protein fortification and extension of the human diet than non - fat milk, butter - milk or whey. These products are more expensive than last ones and differ in nutritional value (Table 2, Table 3).

2. Amino acid composition

Protein additives can increase protein level and improve nutritional value of products in which they are impact. The nutritional value of proteins (and products) depends on the amino acid composition. The main results of amino acids analyze of protein additives are shown in Table 2.

The tryptophane and methionine were first limiting amino acids in all samples. The methionine content of the FAO reference protein is high (2,2 g/ 100g protein) and in comparison with it many other protein sources, except sodium caseinate with 2,0 g methionine/ 100 g protein, have a low content of this amino acid. The sunflower protein was lower in lysine and isoleucine than the FAO reference protein, too. Both, it and whey protein concentrate, contain nearly trypthopane content to standard protein. Milk proteins contain excessive quantities of isoleucine in which sunflower and blood proteins are deficient. The big differences in amino acid composition of pork protein and additives were found, also. So, a complementary nutritional effect can be achieved in blends that contain different sources of

proteins. These blends are superior to the protein alone. They would not change common meat mineral composition or would improve the nutritional value of products in large level.

Effect of the addition of 5% of analyzed proteins instead of respectively content of meat (to keep the same level of protein) is given in Figure 1.

The changes that may carry the addition 5% of protein additives are not higher when 25%. The highest differences as shown in Figure 1 are in triptophane content when blood proteins and soy isolate are added. The supplementation of meat may cause increasing only in content of isoleucine (with lighten blood) valine (with blood proteins and sodium caseinate) and phenilalanine (with lighten blood and sunflower protein). In other case - contents of essential amino acids will be than in lean meat.

3. Mineral composition of protein additives

Protein additives contain till 10% of minerals. Minerals are necessary for normal vital activity and their content in meat is important as well as amino acids'. Qualitative analyses of protein additives allowed to concern main mineral, some of which have been found quantity (Table.3).

SBM, SNK															

Content of Cu in vegetable protein was found higher than in animal origin. Sunflower protein and soy isolate have especially high content of this element (respectively 30,7 and 10,4 mg/kg). In sunflower and soy protein additives 7,5 - 43,4 mg/kg Mn was established. The highest level of this element in milk additives - 1,3 m/kg. The big variations in content of Fe according the protein origin were found, also. Concerning macrominerals big differences of protein additives and reference pattern - meat were found and may be seem very good in Figure 3.

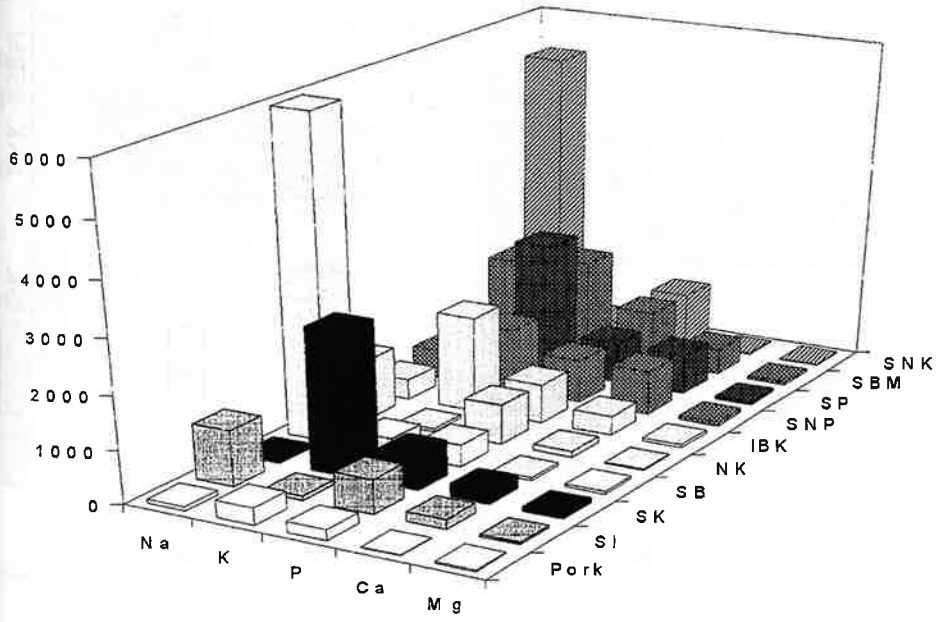

Figure 3. Macromineral composition of pork and protein additives (mg / 100g)

Using of meat substitutes with so high differences in mineral composition may disbalance mineral content of common food.

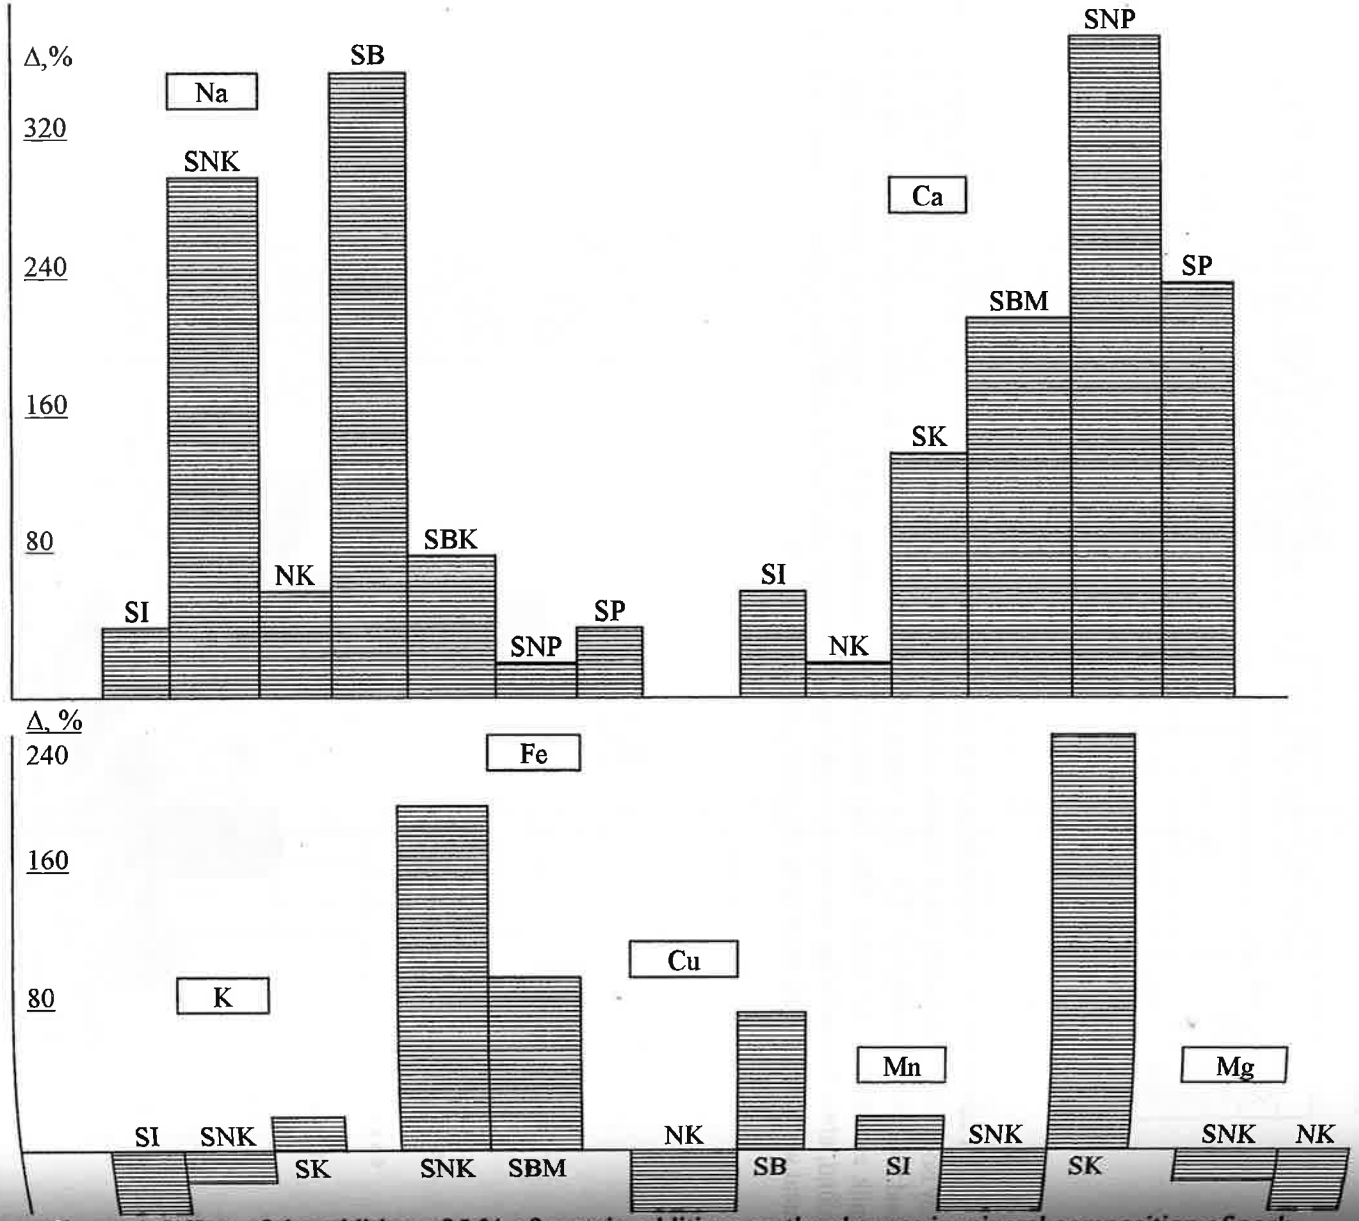

Figure 4. Effect of the addition of 5 % of protein additives on the changes in *mineral composition of pork*

The possible changes with addition 5 % of protein additives are higher than in case of amino acids (from 20 till 380 %). So, mineral composition as well as amino acid composition is necessary criteria to evaluate nutritional value of meat substitutes and to predict possible changes in composition of meat products.

- *CONCLUSION*

1. Analyses of influences on common meat product show quantitative differences in the composition of micro- and macrosubstances of the muscular tissue of the pork and protein additives. Bases on estimation of differences between meat and protein additives in amino acid and mineral composition the best meat substitutes are soy isolate, sodium caseinate and sunflower protein.

2. Whichever of analyzed protein additives in formula of meat products will change usual meat composition. Complementary nutritional effect can be achieved in blends which contain different sources of proteins. The complex proteins blend as substitute will be superior to the protein alone because of minor changes in nutrients. This blend may amend nutritional value of lower quality meat.

Vitamin C	192,0	Riboflavin (B_2)	6,0
Tocopherol (E)	980,0	Niacin (PP)	164,0
Protein digestion "in vitro", % to tyrosin	79,5	Energy value of 100 g of product kJ	635±10

* Were determined by calculating (with regard for coefficients of thermodegradation) according to recommendations of Nutrition Institute of the Russian Academy of Medical Sciences

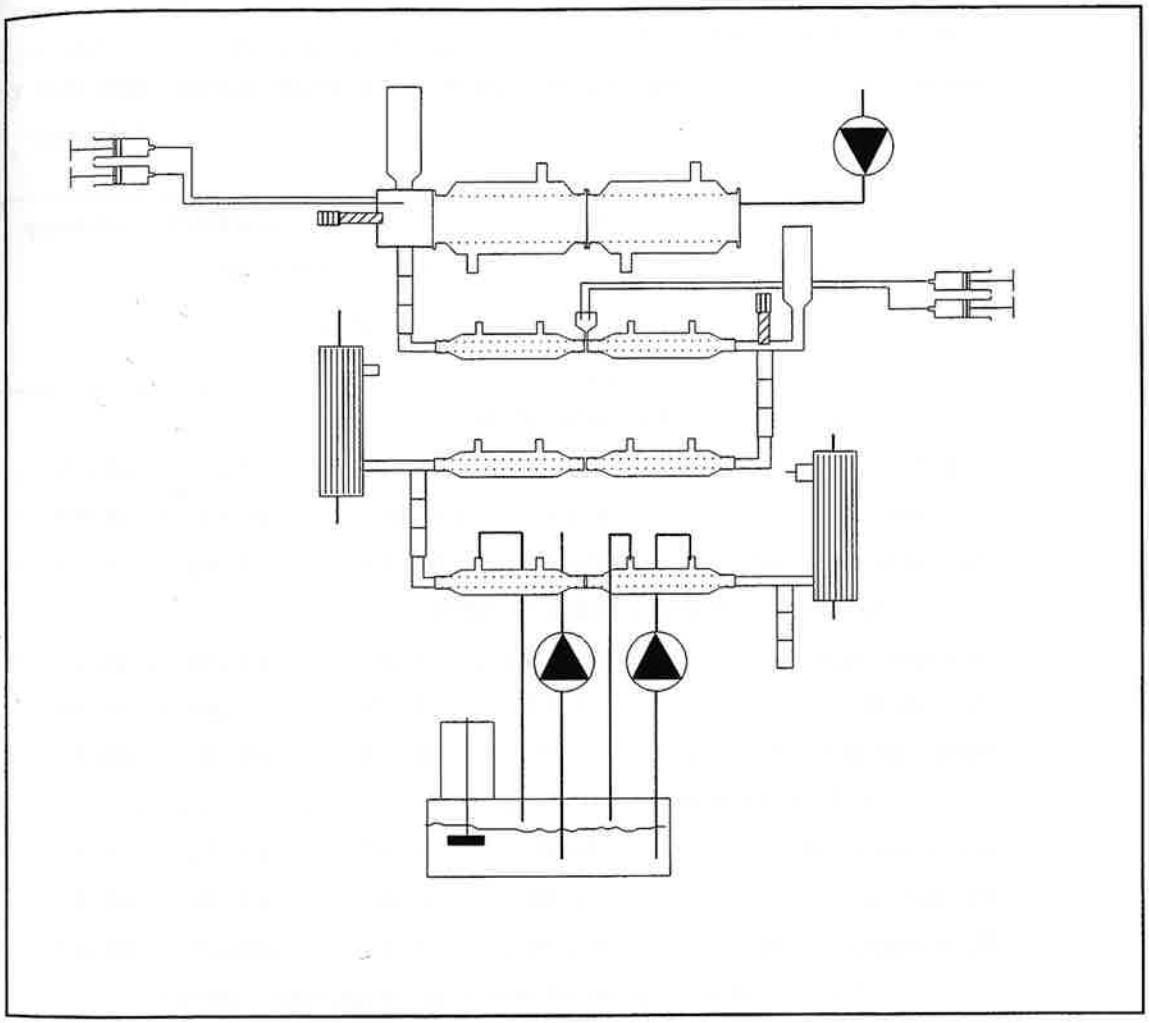

fig. 1. Schematic drawing of the TNO gastro- Intestinal Model (TIM)

Table 1

Digestion of Protein-containing raw material

Protein-containing raw material and type of preliminary processing	mg of tyrosine/g of protein			Percent to tyrosin
	Under action of pepsine	Under action of trypsine	Summary	Summary
Soya protein isolate (SPI)				
Non-hydrated	5.17	5.54	10.71	25.75
Hydrated	8.27	8.65.	16.92	42.84
Thermoprocessed	10.40	11.05	21.45	54.31
Cotton protein isolate (CPI)				
Non-hydrated	5.71	6.09	11.79	37.91
Hydrated	7.63	9.76	17.39	55.92
Thermoprocessed	9.19	10.31	20.50	65.92
Sodium caseinate				
Non-hydrated	6.92	7.60	14.52	23.01
Hydrated	8.54	11.61	20.15	31.93
Thermoprocessed	12.29	14.32	26.61	42.17
Diafiltration skimmed milk concentrate (DSMC)				
Non-hydrated	5.79	6.20	11.99	21.00
Hydrated	7.41	7.57	14.98	26.23
Thermoprocessed	9.67	10.10	19.77	34.62
Bone protein isolate (BPI)				
Non-hydrated	2.33	3.88	6.21	55.95
Thermoprocessed	3.37	4.28	7.65	68.92
Micellial mass of Polyporus fungus				
Non-hydrated	7.99	7.56	15.55	53.81
Hydrated	12.20	9.86	22.06	76.37
Thermoprocessed	12.74	10.55	23.20	80.59

Table 2

Digestion of protein contained in animal material

Protein-containing raw material and type of preliminary processing	Digestion			
	mg of tyrosine/g of protein			Percent to tyrosine
	Under action of pepsine	Under action of trypsine	Summary	Summary
Blood plasma				
Raw	7.69	9.41	17.10	32.20
Thermoprocessed	17.85	9.86	27.71	52.18
Blood				
Raw	7.63	9.55	17.18	47.33
Thermoprocessed	10.67	12.96	23.63	65.10
Tripe				
Raw	5.27	5.90	11.17	39.33
Thermoprocessed	7.90	8.79	16.69	66.48
Meat trimmings				
Raw trimmed	6.96	6.06	13.02	41.46
Trimmed fermented	7.53	6.89	14.42	45.92
Trimmed thermoprocessed	12.34	10.49	22.83	72.71
Fermented thermoprocessed	13.98	12.62	26.60	84.71
Beef thermoprocessed (muscle)	16.59	16.00	32.59	88.08
Pork thermoprocessed (muscle)	15.84	15.45	31.29	91.76

Table 3

Digestion of proteins of binary systems

Components and mass quota in binary mixtures				Digestion	
Terms	Quota	Terms	Quota	mg of tyrosine/g of protein	Percent to tyrosine
				pepsin-trypsin	Summary
Plasma	0.9	+ SPI hydrated	0.1	14.72	32.60
Plasma	0.1	+ SPI hydrated	0.9	13.27	33.75
Plasma	0.9	+ CPI hydrated	o.1	11.62	39.22
Plasma	0.7	+ CPI hydrated	0.3	8.63	49.04
Cooked tripe	0.2	+ Pork thermo-processed	0.8	28.59	89.65
Cooked tripe	0.8	+ Pork thermo-processed	0.2	21.13	-

KEY TO TABLE - SUMMARY OF STUNNING PROCEDURES

Abattoir - Number of Abattoirs involved in the Survey

Restraint - **V:** V-Restrainer **Pen:** Pen Restraint

Stunner - **V:** Constant Voltage **C:** Constant Current

Handpiece - **P:** Two Probes **Y:** Y Shaped **T:** Tongs
HB: Head-to-Back

Mean Current - Mean current obtained from chart recordings

Percentage ≥ 1.3 amp - Percentage of chart recording currents ≥1.3 amp

Duration - Duration of stun current

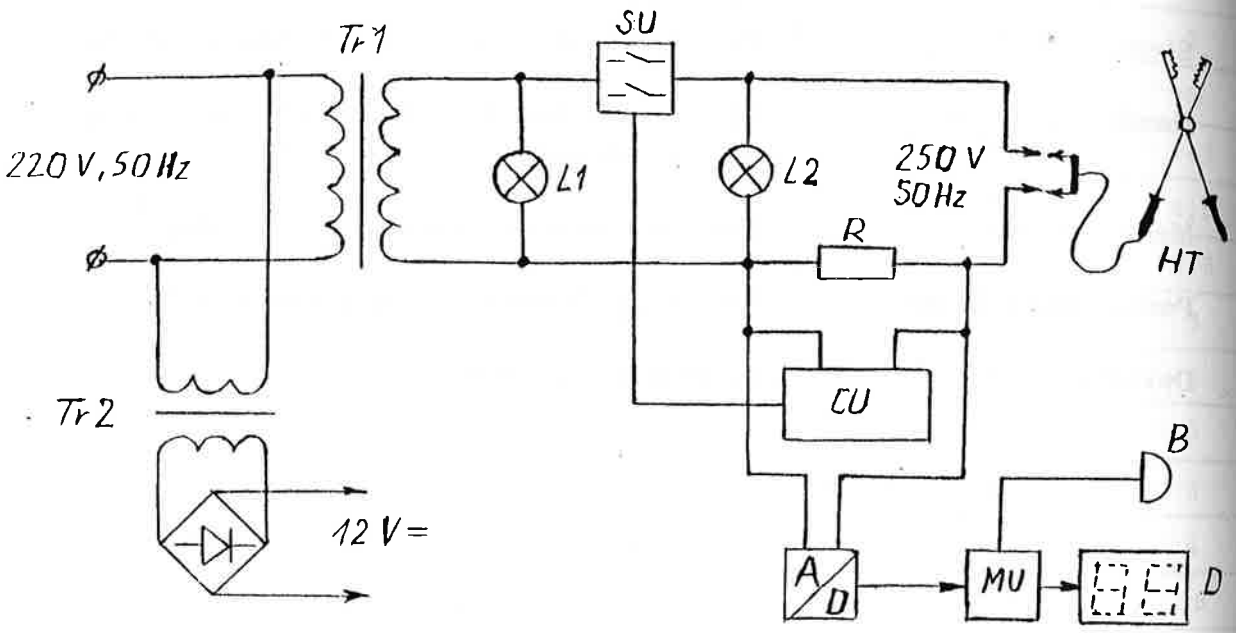

Fig.1. Simplified circuit diagram of the new stunning device (Tr1, Tr2 - transformers, L1, L2 - signal lamps, SU - switching unit, R - calibrated resistor, CU - control unit, A/D - - analog/digital converter, MU - multiplying unit, D - charge digital display, B - bell, HT - hand tongs)

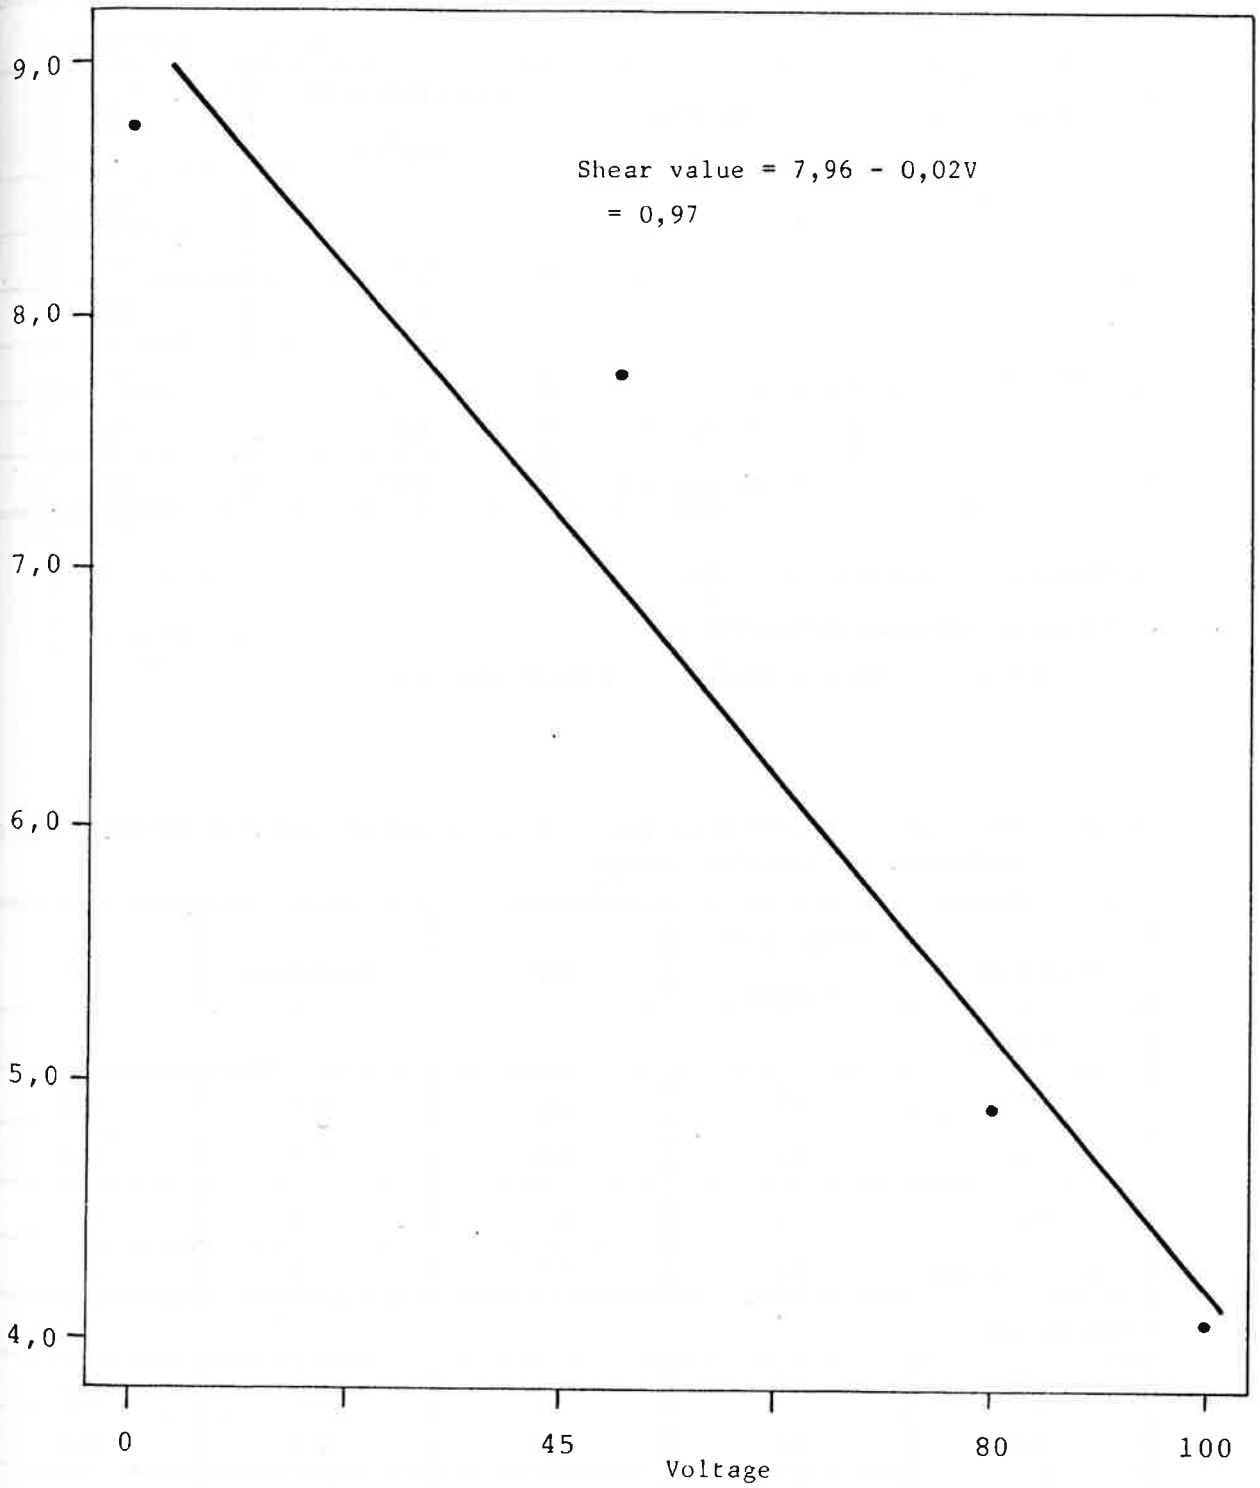

Figure 1. Correlation between electrical stimulation voltage and shear value.

Table 1. Effects of voltage of electrical stimulation and type of boning on the shear value of chicken breast meat.

VOLTAGE [1]	BONING [2]	SHEAR VALUE (kgf/g)	SE
45		7,4 [bc]	0,3
80		6,3 [ab]	0,3
100		5,9 [a]	0,3
Non stimulated		7,8 [c]	0,3
	Hot boning	8,4 [a]	0,2
	Conventionally	5,3 [b]	0,2

1- Means of 50 measurements / voltage.

2- Means of 100 measurements / boning.

a, b, c - Mean with different letters are statistically different.

Table 2. Combined effect of stunning and electrical stimulation voltage on the shear value and tenderness of breast chicken meat.

TREATMENT	Shear Value (kgf/g)	SE	Tendemess	SE
Conventional				
45	5,8	0,5	6,8	0,3
80	4,7	0,5	7,2	0,3
100	4,2	0,5	8,1	0,3

* significant difference, $p \leq 0.05$ for stunning method.
** significant difference, $p \leq 0.01$ for stunning method.
y Haemorrhages in breast and thigh muscles were classified in 5 categories by a visual grading system. Category 1 through 5 indicate increasing prevalence of haemorrhages. The score is presented as a mean value of the scores of 3 persons.
z Haemorrhaging in the wings was classified in 3 categories (1=no, 2=medium, 3=severe).

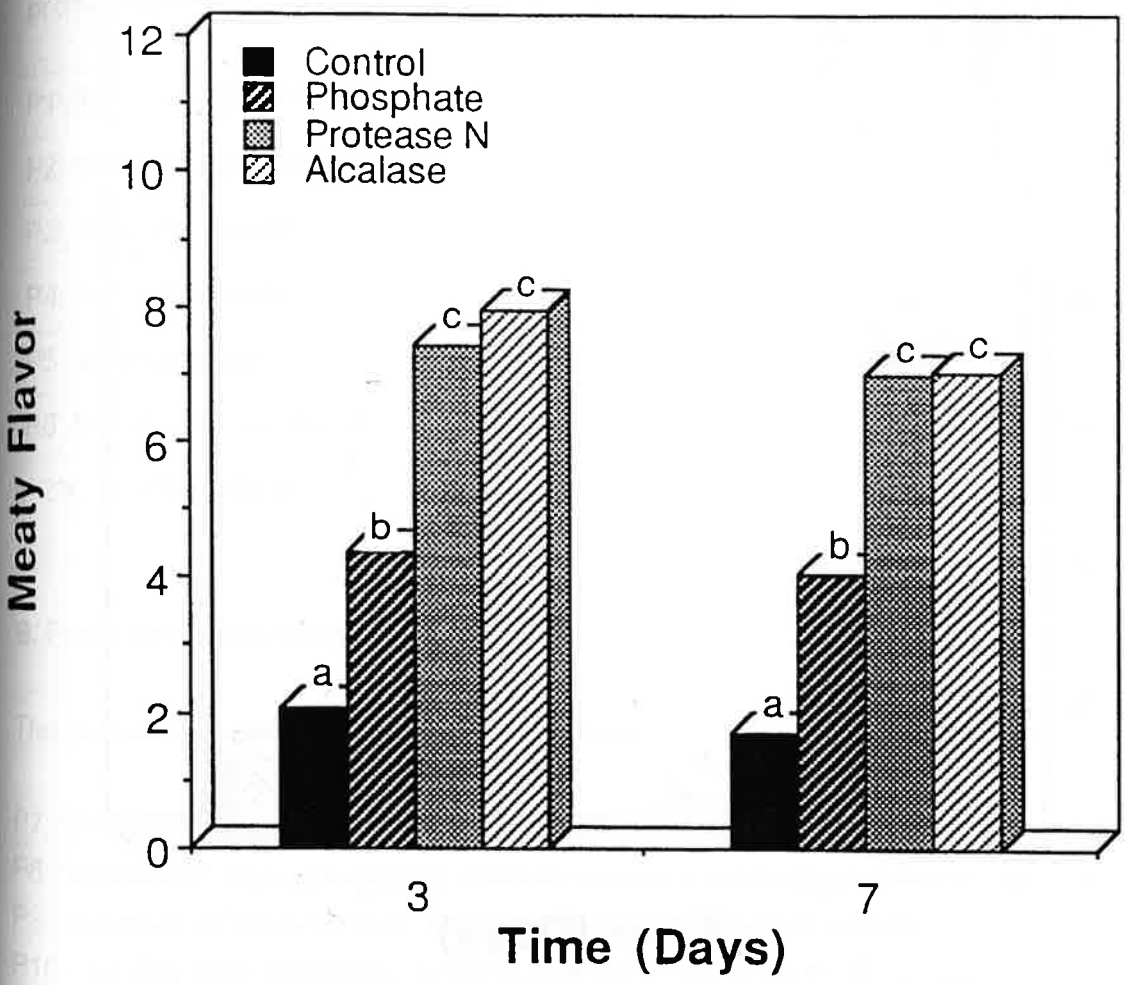

Figure 1. Effect of antioxidants on meaty flavor of precooked vacuum-packaged chopped beef steak during storage of 4°C.
abc Means within a time period with different letters are significantly different ($p<.05$) (N = 2)
Meaty score: 0 = none, 10 = intense
Control = 0.5% NaCl, 2% water; phosphate = 0.5% NaCl, 0.4% STP, 2% water; protease N = 0.5% NaCL, 0.4% STP, 2% SMF made of beef protein hydrolysate (BPH) digested with protease N (0.2%) and peptidase A (0.4%); Alcalase = 0.5% NaCl, 0.4% STP, 2% SMF made of BPH digested with alcalase (0.2%) and fungal protease (0.6%)

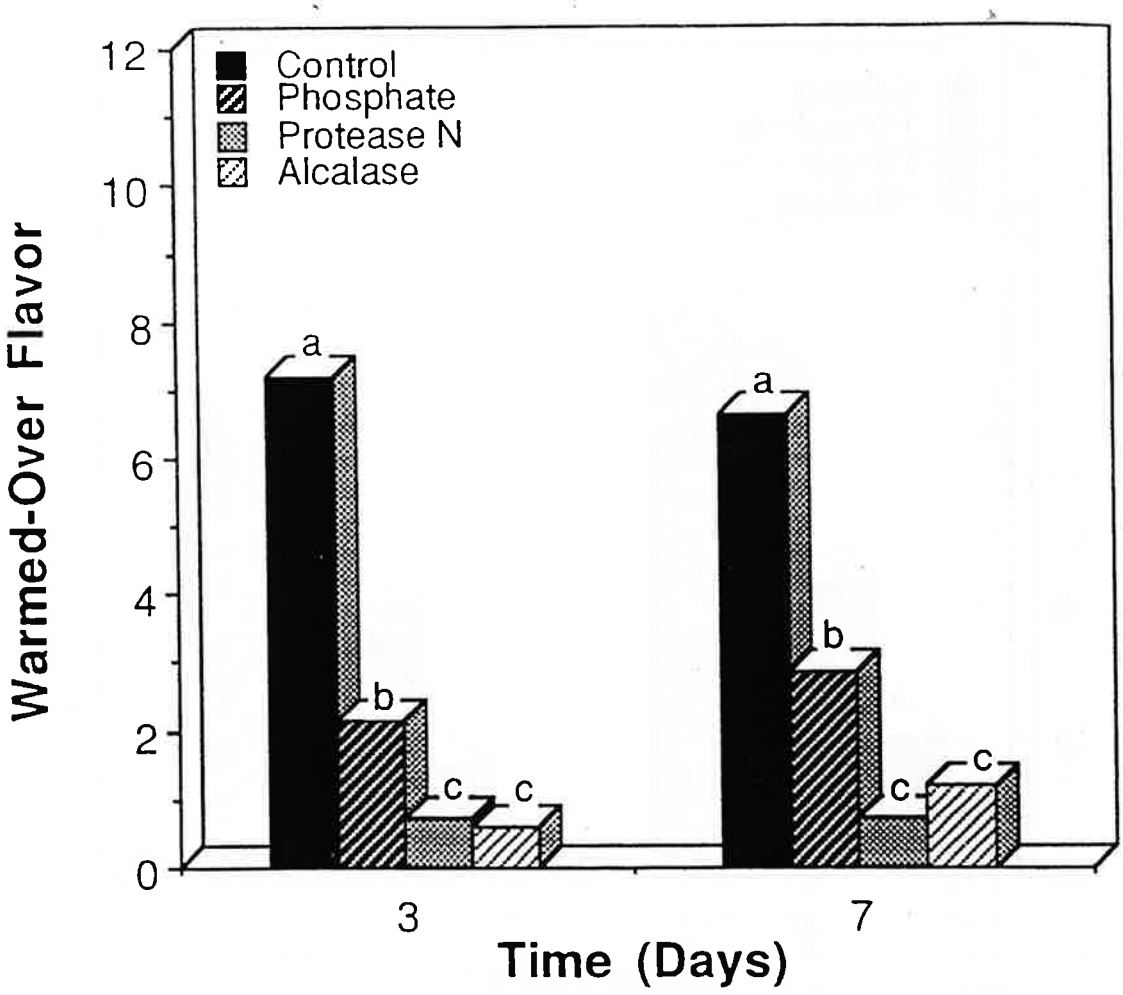

Figure 2. Effect of antioxidants on WOF of precooked vacuum-packaged chopped beef steak during storage at 4°C.
[abc] Means within a time period with different letters are significantly different ($p<.05$) (N = 2)
WOF score: 0 = none, 10 = intense
Control = 0.5% NaCl, 2% water; phosphate = 0.5% NaCL, 0.4% STP, 2% water; protease N = 0.5% NaCL, 0.4% STP, 2% SMF made of beef protein hydrolysate (BPH) digested with protease N (0.2%) and peptidase A (0.4%); Alcalsase = 0.5% NaCl, 0.4% STP, 2% SMF made of BPH digested with alcalase (0.2%) and fungal protease (0.6%)

Table 1: Avaluation of meat products and ready-to-eat meals prepared with addition of collagen hydrolysates (Gelita-Sol, Collagel*); frequency of positive evaluation:
+ >50%, ++ ≥75%, +++ = 100%

product tested	taste, flavour	colour	lowering of consistency (%)
P1: liversausage in casing	+		15.5
P2: liversausage sterilized	+	++	23.2
P3: liver pâté baked	++	++	14.1
P4: liver pâté fresh*			a: 28.3; b: 68.4
P5: spreading paste	+++		
P6: turkey pâté sterilized	+++	+++	13.3

a: 2%, b: 3% Collagel

B. Frankfurter (scalded) sausage type

The products investigated under this headline are characterized as follows:

P7: "Bratwurst" (frying sausage), finely comminuted, scalded, in natural casings
P8: "Bratwurst" (frying sausage) medium coarse (minced), scalded, in natural casings
P9: meatloaf ("Fleischkäse"), finely comminuted, baked in molds
P10: hot dog-type sausages, canned and sterilized, in peel-off casings
P11: wieners, fresh product, scalded, in collagen casings
P12: luncheon meat, canned and sterilized
P13: ham-sausage ("Bierschinken"), scalded, in natural casings

All products (P7-P13) contained an addition of 2% Gelita-Sol. The results of the sensory tests and of measuring the product's consistency are listed in Table 2.

The addition of 2% Gelita-Sol has a positive effect on the taste and flavour of hot dogs, wieners and luncheon meat (see Table 2). First of all the meat aroma has been intensified, and the colour and colour stability of meatloaf, wieners and ham-sausage have been improved.

Table 2: Avaluation of frying sausage and frankfurter sausage type containing 2% collagen hydrolysate (definition of positive evaluation see legend to Table 1)

product tested	taste, flavour	colour	changes in consistency (%)
P7: "Bratwurst", fine			+19.9
P8: "Bratwurst", medium			+15.2
P9: meatloaf		+++	+20.0
P10: hot dog	++		+19.8
P11: wieners	++	+++	
P12: luncheon meat	+		+38.1
P13: ham-sausage		+++	

Also, a stabilization of emulsion binding properties (not shown in Table 2) with a resultant improved cutting firmness and a generally firmer consistency were in evidence in these Gelita-Sole containing product samples. In addition, a reduction in frying and grilling losses in a magnitude of 10 to 30 per cent could be determined as a substantially favourable calculatory factor. The lowering of the water activity also effectuated in these products by the use of the added collagen hydrolysate, brought about improved product keepability expressed as longer product shelf-life.

C. Ready-to-eat-dishes

A third group of meat products, so-called ready-to-eat-dishes, were represented by the following (wet and canned) products:

P14: liver dumplings in broth
P15: meat patties in sauce
P16: meat balls in caper sauce
P17: meat dumplings in hunter-style sauce
P18: "Maultaschen" (Swabian style ravioli, filling including ground meat) in broth
P19: goulasch soup, canned
P20: ragout fine with champignons in white cream sauce
P21: ravioli in tomato sauce

he examination of the sensory and technological effects obtained by adding Gelita-Sol r, respectively, Gelita-Collagel, both at a two per cent dosage level, to the wet, canned ategory leaded to the results listed in Table 3.

able 3: Evaluation of taste, flavour and consistency obtained from gelatin products (GS Gelita-Sol, CG = Collagel; to products not specially assigned GS was added); equency of positive evaluation: - < 50%, + >50%, ++ ≥75%

product tested	taste, flavour	colour	consistency changes (%)	
			Gelita-Sol	Collagel
P14: liver dumplings	++	++	-21.2	+2.8
P15: meat patties	++	++		
P16: meat balls			-20.3	+6.5
P17: meat dumplings			-15.3	+3.0
P18: "Maultaschen"			-20.1	-12.0
P19: goulasch soup	++	++		
P20: ragout fine	GS: - / CG: ++	GS: + / CG: -		

he addition of Gelita-Sol has produced clearly a positive effect on the product's taste, avour and colour. A point which stands out with the "ragout fine" is the fact, in this articular case, the sample made with Collagel turned out to be the one on which ositive evaluations dominated.

he change in consistency of the insert materials made from basic product mixes shows at, for samples containing Gelita-Sol, a softer consistency was observed, while those ontaining an equal concentration of Collagel (two per cent) the consistency was firmer. addition, for all samples, including ravioli (not listed in Table 3), the net insert weight early rose during storage to a higher extent than the "control" samples.

general the results show that the following possibilities of quality improvement and ontrollability of product properties emerge:

a) improvement of taste and product-specific flavours, such as the typical aromas of eat or liver, for instance,
b) more beautiful, stronger product colour and improved colour rentention,
c) ability to improve the consistency of insert materials in "wet" products,

Table 1.
Characteristics of
Tendercut (TC) Treated Pork *Longissimus* Muscle.

Trait[a]	Treatment		S.E.
	Control	TC	
Cooked Pork Chop			
Warner-Bratzler			
Peak force (kg)	4.62[b]	3.96[c]	0.13
Lee-Kramer			
Total energy (kg*mm)	224.1[b]	187.9[c]	9.57
Shear force (kg)	35.2[b]	30.1[c]	1.12
Raw Pork			
Sarcomere length (μm)	1.58[c]	1.88[b]	0.02
Fat (%)	3.80[b]	3.74[b]	0.17
Moisture (%)	72.9[b]	72.8[b]	0.15

[a]Trait: The following traits had significant ($P<0.05$) treatment by location interactions: Warner-Bratzler peak force and sarcomere length.

[b,c] Means bearing unlike superscripts within each trait are different ($P<0.05$).

Table 2.
Effect of Location[a] on
Tendercut (TC) Treated Pork *Longissimus* Muscle.

	LOCATION						
	1		2		3		S.E.
	Control	TC	Control	TC	Control	TC	
Cooked Pork Chop							
Warner-Bratzler Peak Force (kg)	4.40[b]	3.79[c]	4.81[b]	4.02[c]	4.65[b]	4.07[c]	0.24
Lee-Kramer							
Peak Force (kg)	35.04[b]	29.04[c]	34.81[b]	32.66[b]	35.68[b]	28.56[c]	2.43
Total Energy (kg*mm)	222.8[b]	174.9[c]	220.4[b]	197.4[b]	229.0[b]	191.4[b]	15.8
Raw Pork							
Sarcomere Length (μm)	1.58[c]	1.99[b]	1.58[c]	1.89[b]	1.59[c]	1.78[b]	0.05

[a] *Longissimus* muscles were removed between the 9th thoracic and 4th lumbar vertebra, and divided into three equal sections (Location 1, 2, 3; anterior to posterior).

[b,c] Row means bearing unlike superscripts within each location are different ($P<0.05$).

Table 1

Coefficient correlations between EMG (sum area) or sensory values (hardness) and mechanical measurements (n = 6, shaded values for $p < 0.05$)

Subject	Compression Compression modulus (L, K = 0.2)		Shear Force (L, destructive)		Viscoelasticity Phase angle (A)

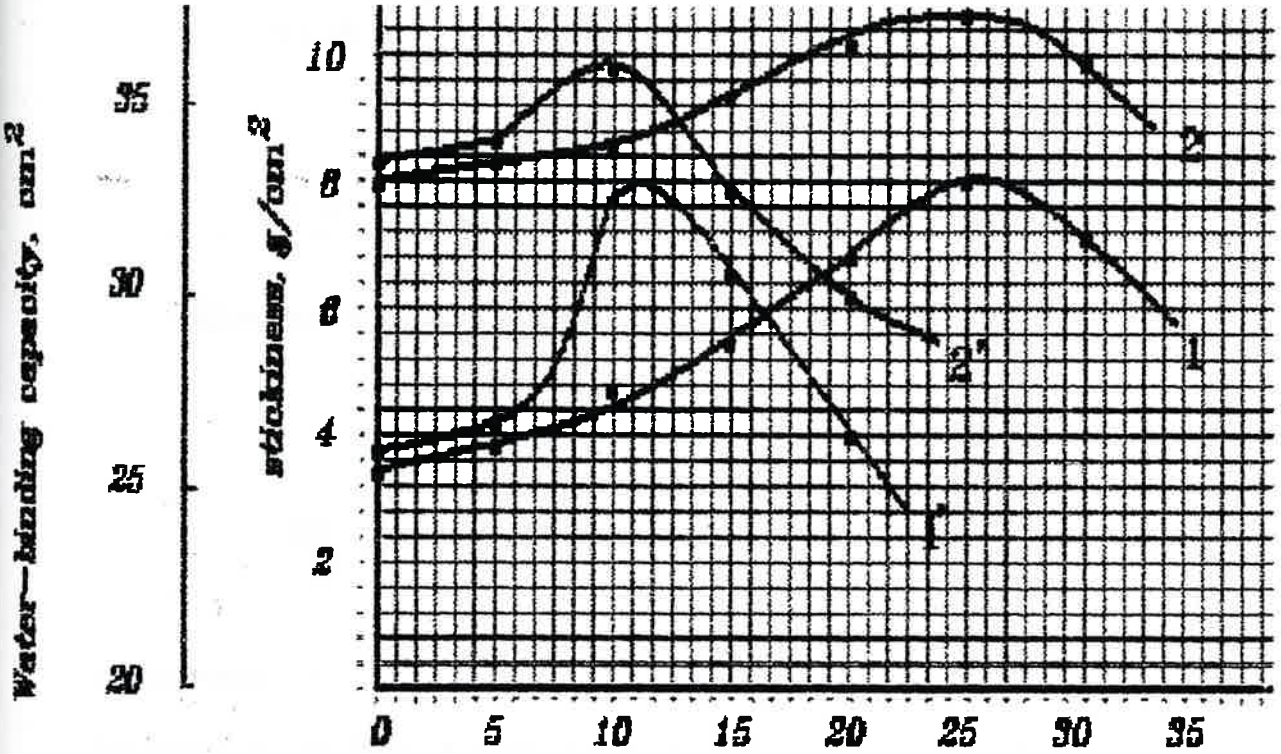

Figure 3.

Function qualities of sample force—meats at the substitution of the principal raw material by food additives: (1, 2) – on the base of tankage; (1', 2') – on the base of poultry heads and legs; 1 – stickiness; 2 – water –binding capacity

$$E = \frac{C}{M}\int_{t0}^{tf} T.V.dt \quad (1)$$

$$E = \frac{C.Vm}{M}\int_{t0}^{tf} T.dt \quad (2)$$

The term $\int_{t0}^{tf} T.dt$ is estimated graphically from the torque profile.

$$dE = -K.\frac{dD}{D^a} \quad (3)$$

where K and a are constants.

$$E = K_r\left(\frac{1}{D_2} - \frac{1}{D_1}\right) \quad (4)$$

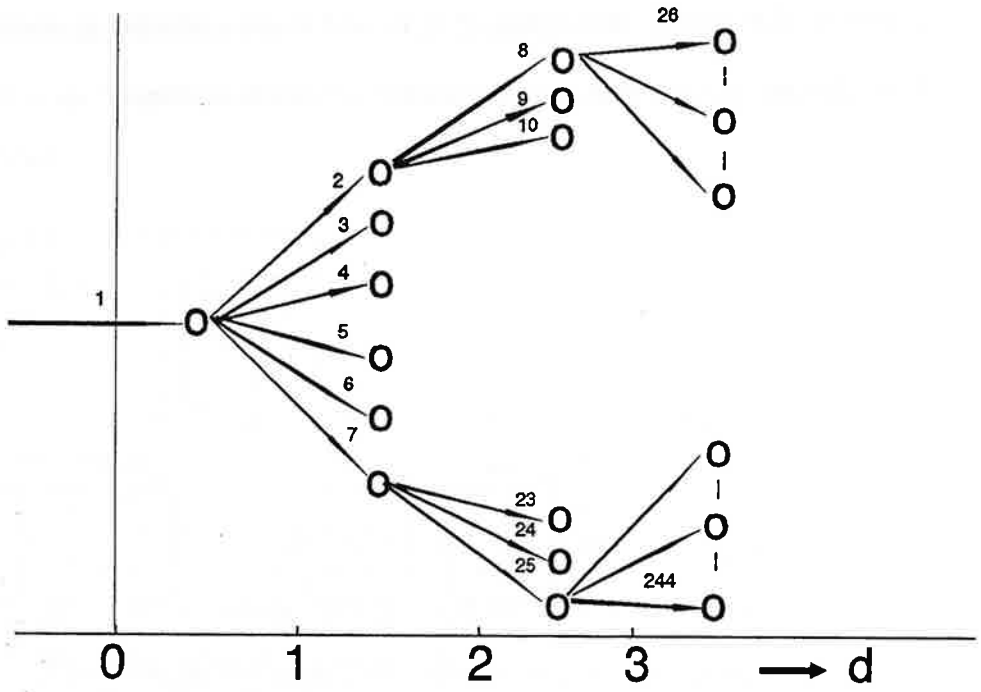
$$E = K_k.\log\left(\frac{D_1}{D_2}\right) \quad (5)$$

$$\frac{E}{W_i} = \sqrt{\frac{100}{D_2}} - \sqrt{\frac{100}{D_1}} \quad (6)$$

$$E = A_1.\log\left(1+\frac{D_1}{D_2}\right) + B_1 \quad (7)$$

$$E = A_2.\log\left(1+\frac{D_1}{D_2}\right) + B_2.K_w + C \quad (8)$$

FIGURE 1 Decision tree.



2.2 Modeloptions

The mixed integer linear programming model (see figure 1) is based on a decision tree containing three decision moments (indicated by d=1,2,3):

d=1: way of sorting the by-products (raw materials) after slaughtering

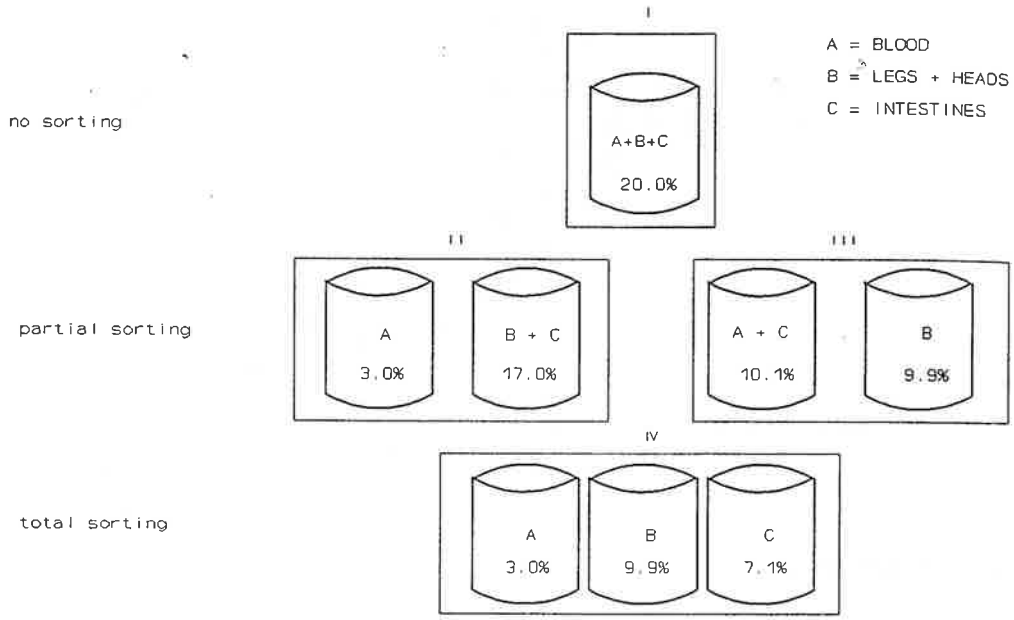
d=2: way of storage

d=3: way of processing (both central and decentral processing)

d=1: *Sorting raw materials*

At decision moment 1 can be chosen in which way three kinds of poultry and pork slaughter by-products A, B and C will be sorted. Possibilities are given in figure 2. So it is suggested to sort the slaughter by-products in four ways so-called sorting groups. These sorting groups result in six different raw-material combinations. Because of incomparability the combination A+B is not considered.

FIGURE 2. The four sorting groups (I to IV) in the model for poultry slaughter by-products. Different combinations of A, B, and C are collected in containers. Also the mass percentage in relation to live weight has been displayed.



d=2: *Storage*

After the release of slaughter by-products some way of buffering is necessary. The following options are considered:

(i) Unconditioned storage: this storage is interesting for the sorting groups with a relatively low spoilage rate and a short time lag between release and processing.

(ii) Cooled storage: this storage is interesting for the sorting groups with a relative high spoilage rate and/or a long time lag between release and processing.

(iii) Frozen storage: this storage is interesting for the sorting groups with a relative high spoilage rate and/or a very long time lag between

Table

Results of determination of activity (A, thousand of conventional units) of rennet enzyme as dependent on conditions of vibration treatment (τ, f) at the first stage of extraction at different concentration (c) of the extracting solution

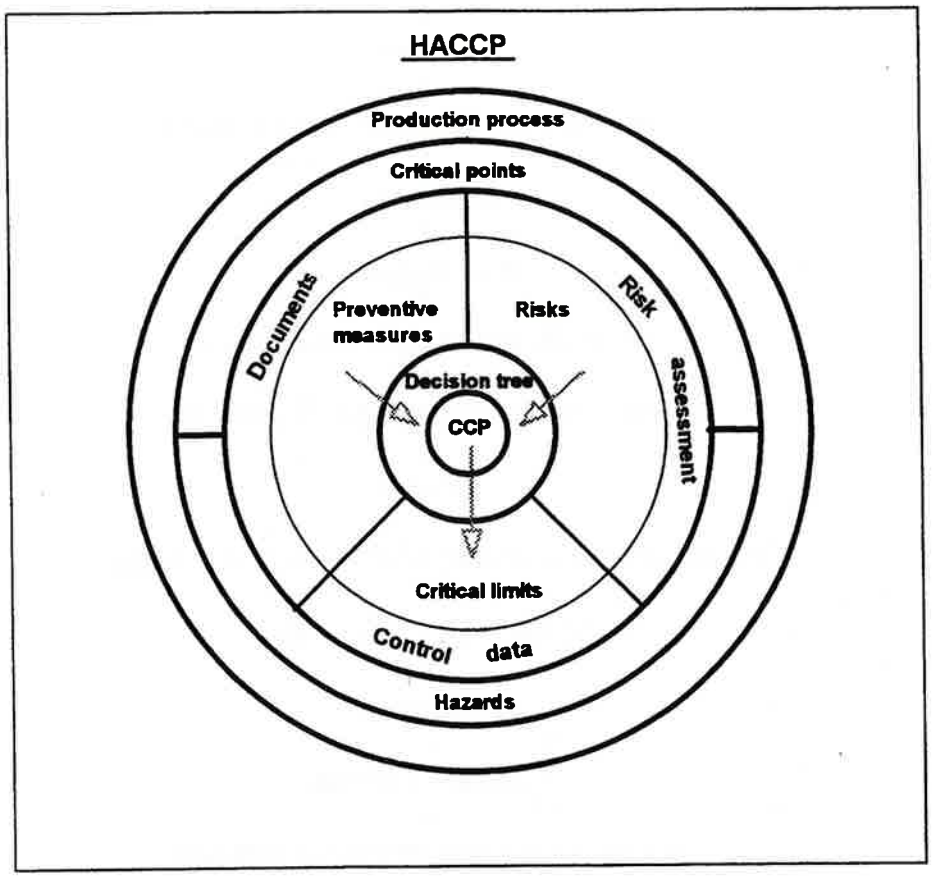

Figure 2. The essence of the HACCP method.

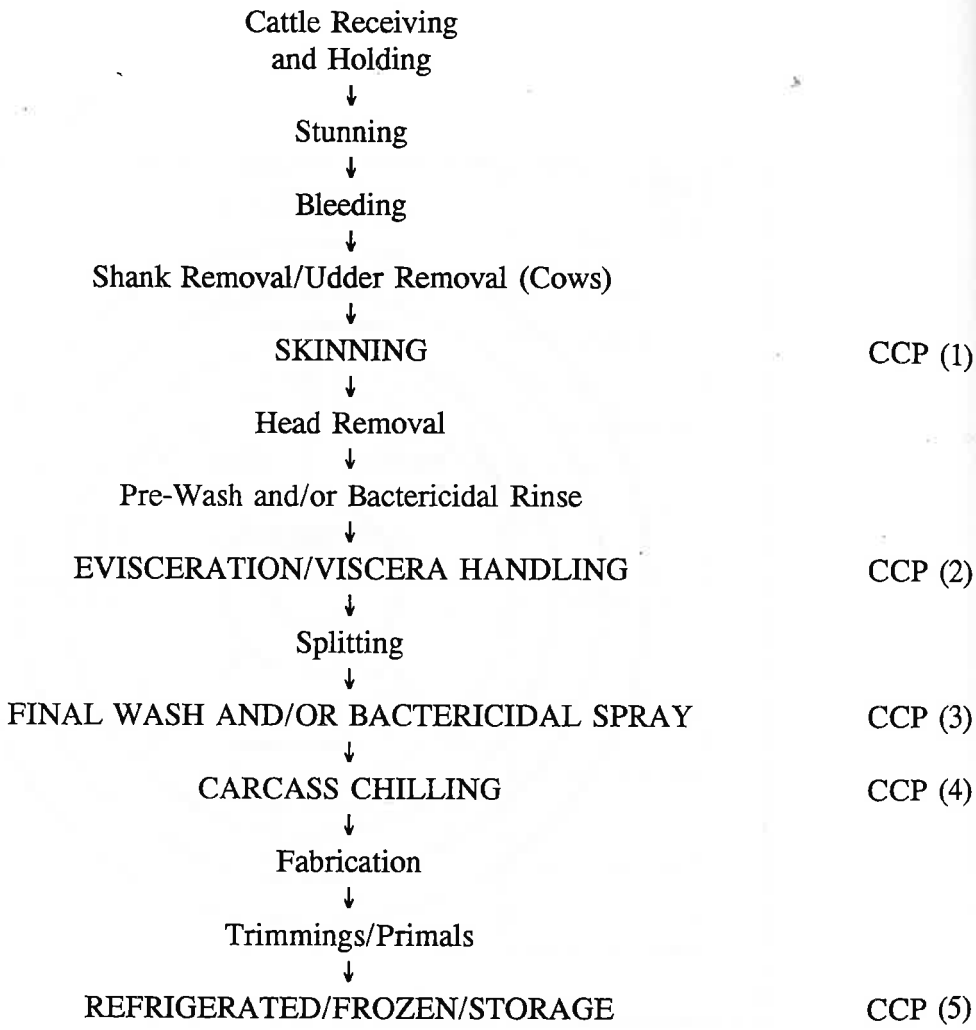

Figure 1. Beef slaughter and fabrication, example flow chart (CCP:critical control point).

Process/Step	CCP	CL	Monitoring Frequency	Records
SKINNING	1	0% dressing defects	Every hour	Random post-skinning carcass examination log-book
EVISCERA-TION	2	0% occurrence per single carcass of: fecal material, ingesta, urine or abscesses	Every hour	Random post-evisceration carcass examin-ation logbook
FINAL WASH	3	Organic acid rinse (a) Wash 32-38°C; 2,585-15,514 mmHg; 1 to 2% acid - or (b) 20-25 ppm chlorine; 517-2,069 mmHg	Every two hours	(a) Final spray wash and bac-tericidal spray logbook (b) Logbook of preventive main-tenance
CARCASS CHILLING	4	(a) Deep muscle (15 cm) to be <7°C	(a) Small plants, 1 of 10 carcasses; large plants, 1 per hour (b) Every hour	(a) Record deep-muscle tempera-ture of carcas-ses/cuts (7°C) prior to boning and keep temper-ature logbook (b) Carcass spacing: 3-5 cm apart; logbook
REFRIGER-ATED STORAGE	5	(a) All boneless meat/ trimmings temperatures shall be at ≤4°C at all stages of storage, transportation and distribution (b) Storage tempera-ture at 0°C	(a) Every four hours (b) Every four hours	(a) Maintain boneless meat/ trimmings temperature log-book (b) Keep cooler and trailer temperature log-book

Figure 2. HACCP model for beef slaughter and fabrication: process/step, critical control points (CCP), critical limits (CL), frequency of monitoring, and recording requirements.

TABLE N°1 CRITICAL CONTROL POINTS OF THE POULTRY SLAUGHTERHOUSE.

PROCESS STEP	CCP HAZARD NUMBER	CCP DESCRIPTION	CRITICAL LIMITS	MONITORING	CORRECTIVE ACTION	HACCP RECORDS	HACCP VERIFICATION
CLEANING AND DESINFECTION (SANITATION)	-CCP.N°1 MICROBIOLOGICAL	-PRE-OPERATIVE SANITATION (VISUAL)	-VISUAL CONTROL.	-PRE-OPERATIVE VISUAL INSPECTION OF EQUIPMENT AND ENVIRONMENT.	-REWASH, SANITIZE, REINSPECT, PRIOR TO THE OPERATION. -REVIEW THE SANITATION PLANT. -INSTALLATION AND MACHINERY DESIGN.	-RECORD ALL RESULTS AND CORRECTIVE ACTIONS. -CHECK LIST	-AUDIT TO VERIFY THE SANITATION. -MICROBIOLOGICAL SURFACE ANALYSIS (RODAC PLATE) (TARGET VALUE OF 10^2 IN TOTALS.) -AUDIT HOW THE RECORDINGS ARE TAKEN AND HOW THE GOOD MANUFACTURING PRACTICES ARE CARRIED OUT.
SLAUGHTER MACHINE	-CCP.N°2 MICROBIOLOGICAL	-BLADE REGULATION.	-SLAUGHTER MACHINE REGULATION.	-EQUIPMENT INSPECTION BEFORE EACH LOT. -DAILY BLADE CHANGE.	-EQUIPMENT REGULATION. (DEPENDING ON THE NUMBER OF LOTS TO WORK)	-RECORD ALL DATA DEPENDING ON THE SIZE AND TYPE OF THE CHICKEN.	-SLAUGHTER OPERATION INSPECTION, DEPENDING ON THE QUALITY OF CONTROL IN DIFFERENT LOTS.
SCALDING	-CCP.N°3 MICROBIOLOGICAL	-FRESH WATER INPUT	-0,8 LTS.WATER INPUT PER BIRD (CHICKEN) WHICH GOES THROUGH THE SCALDING MACHINE.	-MONITOR FLOW TO MAINTAIN AN INPUT OF 0,8 LTS.OF FRESH WATER PER BIRD.	-ADJUST FRESH WATER FLOW, RECHECK EVERY 15 MINUTES DURING ONE HOUR, THEN ONCE EACH HOUR.	-RECORD ALL THE RESULTS AND CORRECTIVE ACTIONS IN A CHECK LIST.	-VERIFY CALIBRATION OF METERING METHOD OF WATER SUPPLY.
PLUCKING MACHINE	-CCP.N°4 MICROBIOLOGICAL	-PLUCKING MACHINE REGULATION.	-R.P.M. REGULATION (600 R.P.M.) -ROLLER OPENING CONTROL DEPENDING ON THE CHICKEN SIZE.	-EQUIPMENT INSPECTION BEFORE EACH LOT.	-EQUIPMENT REGULATION DEPENDING ON THE LOT. (SIZE AND PHYSICAL SITUATION) -CHANGE THE RUBBER FINGERS IN BAD CONDITION.	-RECORD DATA FROM R.P.M. AND ROLLER OPENING, ACCORDING TO THE TYPE OF CHICKEN.	-PRE-OPERATIVE INSPECTION OF PLUCKING MACHINE. -SECTION EMPLOYEE CAN CARRY OUT THE INSPECTION.

TABLE N°2 CRITICAL CONTROL POINTS OF THE POULTRY SLAUGHTERHOUSE.

PROCESS STEP	CCP HAZARD NUMBER	CCP DESCRIPTION	CRITICAL LIMITS	MONITORING	CORRECTIVE ACTION	HACCP RECORDS	HACCP VERIFICATION
CLEAN PICK WASHER AND FINISHER	-CCP.N°5 MICROBIOLOGICAL	-WATER CHLORINATION. -WATER QUANTITY. (1,5 LTS.PER BIRD) -WATER TEMPERATURE (15°C)	-≥3PPM -VOLUME,PRESURE AND SUITABLE WATER DIRECTION.	-CARCASSES´ VISUAL CONTROL,TO DETERMINE IF THERE IS CONTAMINATION.	-INFORM MAINTENANCE GROUP. -ADJUST CHLORINATION AND OBSERVE IT DURING 15 MIN. -ADJUST THE CAUDAL, PRESSURE AND WATER DIRECTION. -CONTROL THE TEMPERATURE.	-RECORD THE CHLORINATION LEVEL AND CORRECTIVE ACTIONS. -RECORD DATA PRESSURE AND VOLUME.	-CHLORINATION "KIT" CONTROL. (VOLUMETRY WITH Na TIOSULFATE) -MONTHLY MICROBIOLOGICAL ANALYSIS. -ANNUAL PHYSICAL-CHEMICAL ANALYSIS. -CONTROL WATER PRESSURE AND VOLUME.
CROPPING	-CCP.N°6 MICROBIOLOGICAL	-EMPLOYERS´ SANITARY EDUCATION. -KNIFE STERILIZER TEMPERATURE.	-MEAT MANIPULATOR LICENCE. -GOOD MANUFACTURING PRACTICES (G.M.P.) -T°≥82°C	-SANITARY DIRECTIONS. -CHECK LIST. -RECORD THE T° OF THE KNIFE STERILIZER. -OBSRVE IF THE EMPLOYEE USES IT.	-INFORM THE EMPLOYEE -INFORM THE SECTION EMPLOYER IN CHARGE. -INFORM THE MAINTENANCE GROUP. -KNIFE STERILLIZER SANITATION.	-CHECK LIST. -CHECK LIST.	-VISUAL INSPECTION BY QUALITY CONTROL -MICROBIOLOGICAL ANALYSIS OF HANDS, GLOVES,ETC. -CALIBRATER THERMOMETER. -MICROBIOLOGICAL ANALYSIS OF KNIVES AND WATER. -PERIODIC STERILIZER CHECKING.
MANUAL TRANSFER	-CCP.N°7 MICROBIOLOGICAL	-EMPLOYERS´ SANITARY EDUCATION.	-MEAT MANIPULATOR LICENCE. -GOOD MANUFACTURING PRACTICES. (G.M.P.)	-CHECK LIST. -GOOD MANUFACTURING PRACTICES.(G.M.P.)	-INFORM EMPLOYEE. -INFORM THE SECTION EMPLOYEE IN CHARGE.	-CHECK LIS	-OPERATION INSPECTION BY QUALITY CONTROL. -MICROBIOLOGICAL ANALYSIS OF HANDS,GLOVES,ECT.
MANUAL EVISCERATION	-CCP.N°8 MICROBIOLOGICAL	-EMPLOYERS´ SANITARY EDUCATION. -WATER CHLORINATION. -KNIFE STERILIZER TEMPERATURE.	-MEAT MANIPULATOR LICENCE. -GOOD MANUFACTURING PRACTICES. (G.M.P.) -CHLORINE≥3PPM. -KNIFE STERILIZATOR T°≥82°C.	-CHECK LIST -SANITARY DIRECTIONS. -CHICKEN VISUALLY CONTROL. -CHLORINATION ANALYSIS. -REGISTER THE KNIFE STERILIZER TEMPERATURE. -CHECK LIST.	-INFORM EMPLOYEE -INFORM THE SECTION EMPLOYEE IN CHARGE. -INFORM MAINTENANCE GROUP.(IF A PROBLEM APPEARS IN THE CHLORINATION AND STERILIZATOR SYSTEM)	-CHECK LIST. -RECORD CHLORINATION REGISTER. -CHECK LIST.	-VISUAL INSPECTION BY QUALITY CONTROL -CHLORINATION "KIT" CONTROL. -WATER AND KNIVES MICROBIOLOGICAL ANALYSIS. -PERIODIC STERILIZER CHECKING. -CALIBRATE THERMOMETER.

TABLE N°3 CRITICAL CONTROL POINTS OF THE POULTRY SLAUGHTERHOUSE.

PROCESS STEP	CCP HAZARD NUMBER	CCP DESCRIPTION	CRITICAL LIMITS	MONITORING	CORRECTIVE ACTION	HACCP RECORDS	HACCP VERIFICATION
INSIDE AND OUTSIDE BIRD WASHER.	-CCP.N°9 MICROBIOLOGICAL	-WATER CHLORINATION. -VOLUME, PRESSURE AND DIRECTION OF THE SHOWER.	-CHLORINE ≥3PPM. -VOLUME, PRESSURE AND DIRECTION SUITABLE.	-CHICKEN VISUAL CONTROL TO DETERMINATE THE SANITATION LEVEL.	-INFORM MAINTENANCE GROUP. -ADJUST CHLORINATION. -ADJUST THE PRESSURE, VOLUME AND WATER DIRECTION.	-RECORD CHLORINATION DATA. -RECORD DATA: PRESSURE, DIRECTION AND VOLUME OF WATER AND SPRINKLERS.	-CHLORINATION "KIT" CONTROL. -MONTHLY MICROBIOLOGICAL ANALYSIS AND ANNUAL PHYSICAL-CHEMICAL ANALYSIS. -CONTROL AND CALIBRATE THE VOLUME AND PRESSURE CONTROLLER. -CONTROL AND CALIBRATE THE SPRINKLERS DIRECTION.
CARCASS CHILLING.	-CCP.N°10 MICROBIOLOGICAL	-TEMPERATURE -COLD WATER CAUDAL. -WATER CHLORINATION.	-T°BETWEEN 1° AND 2°C. -1,5 LTS.OF WATER PER CHIKEN.	-INSPECT THAT TEMPERATURE MANTAINS THE TOLERANCES. -CHECK LIST. -CHLORINE ANALYSIS. -DETERMINATE WATER CAUDAL.	-ADJUST TEMPERATURE AND CONTROL IT EVERY 30 MIN. -INFORM MAINTENANCE GROUP. -RECORD CHLORINE VALUES. -ADJUST CAUDAL.	-RECORD ALL RESULTS AND CORRECTIVE ACTIONS. -CHECK LIST.	-CALIBRATE THE THERMOMETERS AND DRILLS. -CHLORINATION "KIT" CONTROL. -MONTHLY MICROBIOLOGICAL ANALYSIS AND ANNUAL PHISICAL-CHEMICAL ANALYSIS. -VERIFY CALIBRATION OF CAUDAL METERING METHOD.
COLD AIR TUNNEL.	-CCP.N°11 MICROBIOLOGICAL	-TEMPERATURE -AIR RENOVATIONS SPEED.	-T° BETWEEN 2° AND 3°C. -AIR SPEED. (7 MTS/SG)	-CHECK LIST. -MANTAIN THE TOLERANCES TEMPERATURES.	-INFORM MAINTENANCE GROUP. -TEMPERATURE REGULATION. -ADJUST AIR CAUDAL.	-RECORD THE TEMPERATURE AND AIR CAUDAL VARIATIONS.	-CALIBRATE THE DRILLS. -ADJUST THE AIR DIRECTION. -CONTROL THE CHICKEN TEMPERATURE LEAVES THE TUNNEL. (3°C IN SKIN) (17°C IN BREAST)
SECOND CATEGORY CHICKEN SEPARATION	-CCP.N°12 MICROBIOLOGICAL	-SANITARY EDUCATION.	-MEAT MANIPULATOR LICENCE. -GOOD MANUFACTURING PRACTICES. (G.M.P.)	-SANITARY DIRECTIONS -CHECK LIST.	-INFORM EMPLOYEE -INFORM SECTION EMPLOYEE IN CHARGE.	-CHECK LIST.	-INSPECTION BY QUALITY CONTROL. -MICROBIOLOGICAL ANALYSIS OF HANDS AND GLOVES.

TABLE N°4 CRITICAL CONTROL POINTS OF THE POULTRY SLAUGHTERHOUSE.

PROCESS STEP	CCP HAZARD NUMBER	CCP DESCRIPTION	CRITICAL LIMITS	MONITORING	CORRECTIVE ACTION	HACCP RECORDS	HACCP VERIFICATION
PACKAGING (BOXES)	-CCP.N°13 MICROBIOLOGICAL CHEMICAL.	-EMPLOYEE SANITARY EDUCATION. -WHOLENESS AND SANITATION OF BOXES.	-MEAT MANIPULATOR LICENCE. -GOOD MANUFACTURING PRACTICES. (G.M.P.) -VISUAL CONTROL OF BOXES.	-SANITARY DIRECTIONS -CHECK LIST. -VISUAL INSPECTION OF BOXES.	-INFORM THE EMPLOYEE. -INFORM THE SECTION EMPLOYEE IN CHARGE. -INFORM MAINTENANCE TO REGULATE BOX WASHER.	-CHECK LIST.	-INSPECTION OF THE OPERATION BY QUALITY CONTROL STAFF. -CONTROL PRESSURE AND TEMPERATURE IN THE BOX WASHER. -CONTROL IN THE PUMP THAT ABSORBS DETERGENT FROM THE BOX WASHER. -SURFACE MICROBIOLOGICAL CONTROL. (RODAC PLATE) -AUDIT THE QUANTITY OF DETERGENT DILUTE. ERROR: -OVER EXCEEDED: CHEMICAL HAZARD -UNDER EXCEEDED: MICROBIOLOGICAL HAZARD.
COLD-STORAGE	-CCP.N°14 MICROBIOLOGICAL	-COLD-STORAGE ROOM TEMPERATURE. -WHOLENESS AND SANITATION OF BOXES AND PACKING.	-COLD-STORAGE ROOM TEMPERATURE. (T° ± 3°C). -VISUAL CONTROL.	-CHECK THAT THE TEMPERATURE IS WITHIN THE TOLERANCES. -CHECK LIST.	-INFORM MAINTENANCE TEAM. -TO CORRECT NECESSARY TEMPERATURES. -INFORM STORAGE EMPLOYEE IN CHARGE.	-TEMPERATURE RECORDING EVERY 20 MIN. (AUTOMATIC DRILLS CONNECTED TO A COMPUTER AND TO A PRINTER). -CHECK LIST.	-VERIFY THE AUTOMATIC DRILLS. -STORE INSPECTION BY QUALITY CONTROL STAFF.
