THE ROLE OF SCIENCE IN THE MEAT INDUSTRY OF THE FUTURE

G.Page

Industrial Research Limited, Auckland, New Zealand.

Introduction

This paper focuses on the role of science in the meat industry of the future and speculates as to what may be happening in the year 2020.

The meat industry is one which has undergone radical changes over the last 10 years. More than that, looking back over the last 30-40 the changes in technology within the meat industry, the operating principals for farmers processing companies and the way that 5^{120} H₀ developed new skills, has been remarkable. There is no reason to suppose that such a level and rate of advancement will not continue we

The real question is 'where is that advancement likely to occur and how could, and how should the meat industry respond'.

It is as well to remember that there is no value for any industry in failing to recognise there is an in built necessity to change, or in waiting it is five years from a significant turning point in the sector.

Science is about long term investment in a knowledge base. That knowledge base must not be seen simply as learned, written scientific? It is actually knowledge in the heads and in the hands of skilled people, be they scientists, technologists, engineers farmers or plant ope and There will be a marked increase in the technology over the period to 2020 with everyone in a company being more aware of technology The how it might be used within their work environment. There will be an immense growth in the application of different types of technologie gra just related to processing, but technologies that impact on the way that daily business is carried out. In 25 years, business will be with bound by physical structures and buildings the widespread use of networking among firms will be the norm. They will also have a me increased the speed of receiving product orders from the market place. Companies will also see a greater capability at reading weak For signals buried among the mass of data that is often mistaken for information. The time available to position and reposition a company bet global market will have become shorter and shorter. In that context, science and technology will help us maintain and develop market is n and will become a critical issue. In general, breakthrough technologies in a company or even in an industry have often come from out wo those industries. Improvements in tyre technologies did not come from the tyre companies - it came from the development of poly rayon, etc. It can be expected that type of technological crossover is taking place today - more so, it can be expected to take place tomb including the meat industry. Hav

What are the technologies that will maintain market access and will ensure that the New Zealand meat industry is producing the products¹ it can deliver into niche' global markets? It is hoped of course that this occurs at the beginning of new fads and changes in the market agree also hoped that there will be an understanding, as well as the detection of the onset of the changes in the way that the target consumer arg uses meat products. By 2020 this will also involve products produced under vastly improved hygiene standards and quality standards. turn means much better processing and more discernible individualistic on-farm technologies being used. These changes would will certainly foresee a different structure of payment and reward for farmers, for processors, for intermediates in the value added chain through to the consumer.

The Consumer

This is predicated on the assumption that companies actually know what the consumer wants. Consequently, do the meat companies know who the consumer of the year 2020 will actually be? I think not! The competition from white meats and fish, to the red meat in will continue to be intense in traditional markets and yet there are vast areas of the globe where different ethnic preferences exist and whether are wast areas of the globe where different ethnic preferences exist and whether are wast areas of the globe where different ethnic preferences exist and whether are wast areas of the globe where different ethnic preferences exist and whether are wast areas of the globe where different ethnic preferences exist and whether are wast areas of the globe where different ethnic preferences exist and whether are wast areas of the globe where different ethnic preferences exist and whether are wast areas of the globe where different ethnic preferences exist and whether are wast areas of the globe where different ethnic preferences exist and whether are wast areas of the globe where different ethnic preferences exist and whether are wast areas of the globe where different ethnic preferences exist and whether are wast areas of the globe where different ethnic preferences exist and whether areas areas of the globe where different ethnic preferences exist and whether areas areas of the globe where different ethnic preferences exist and whether areas areas of the globe where different ethnic preferences exist and whether areas a meats would be a novelty- if red meat is seen in the diet at all. Of course in many Asian countries the flavour and texture preference of food products is quite different from the traditional Anglo-Saxon preference. So what is known about the consumer preferences in countries, or those ethnic groups. Compared to what we need to know, we know very little indeed.

In the science community an area of expertise with a quite sophisticated capability of doing complex mathematical analysis. In many area the world, nuances of flavour and texture are very subtle and even beyond, dare it be said, the Anglo-Saxon ability to distinguist characteristics of acceptable products. Scientifically some of those applied mathematical analytical tools, stretch between traditional stational science and sociological variables and will require a much further degree of sophisticated development. Those techniques require analysis from competent applied mathematicians and yet in this country there is a dearth of such trained people. Indeed it is one scientific areas in which an abundance of skills should be available but is where a consistent failure to fund and develop and to encourage nation is seen. Such skilled people move beyond providing simple statistics. They actually contribute by guiding the way that science technology can be used to design and make products for niche markets. They are going to be a vital resource if weak market signals ember in complex consumer preference data are to be reliably interpreted.

However, flavour and texture are but two small aspects of product preference differences which many products experience, when many products experience, when many products experience, when many products experience whe between national or ethnic groups. In addition, just the straight presentation of a product, is very different in China, Japan, the United straight presentation of a product, is very different in China, Japan, the United straight presentation of a product of the straight presentation of the Australia, etc. If the industry is in a global market place and if it isn't now, it will be, then companies must be able to handle these sub and have a structure and capability to address such issues. In short, in 2020 the industry will face a world of a collection of very difference of the transformer of niche product areas - a niche' in terms of the type of product characteristic as defined by its quality, texture, flavour, presentation, by

Isn in The be rec to tell it is Con the mo The resp the What thro

Will Con For For Gov Pest othe if N The com the leve peop That ansv deve It is

Vari Tra Hav

Supp

abor mar Will Will be c Isn't this just what happened with Kobe Beef in Japan. Perhaps the origins of such a market preference can be argued about, but the fact of life in business terms, is that Kobe Beef is the high value product in Japan. It's a niche' market product in global terms.

There is no reason to suppose that other niche market products have a place elsewhere in Asia or indeed in America. So a question that should be approved to the development limit of a product be answered is - how do we go about defining products that are required in these markets and how is the development limit of a product tecognised early enough e.g. how could the fact that the life of the frozen carcass was ending? So between now and 2020 the problem of how to determine what it is that consumers generally want must be addressed. What is meant by a convenience product? In truth, are we actually telline t telling the market what we think they need in a meat product and that therefore it is a convenience product? Or are the consumers asked what 2020. it is that they actually want out of red meat products - the way it is presented, the time it takes to actually prepare a meal and indeed how do consumers view the experience of sitting down to meat and two veg? Do they see it as an entertainment? An experience? Do they see it as just a novelty, as a one off? Does it actually generate excitement that will encourage the 'I want to try it again and again and again phenomena?' at stal How much does the industry really know about the consumer use and perceptions of meat products. It is probably very little. By the year 2020 the mean does the industry really know about the consumer use and perceptions of meat products. It is probably very little. By the year 2020 the mean does the industry really know about the consumer use and perceptions of meat products. It is probably very little. By the year 2020 the meat industry moves from being a commodity supplier, to being a highly sophisticated niche' market supplier of convenience foods a lot more must be known. By 2020 should the meat companies be focusing primarily on supplying meat or multi-component foods?

These issues and questions are complex and not new. It is often difficult even to define what the right question is, let alone measure what the response to such questions. In 25 years, it will offer tesponse is and what it means. Science can help and it often steers, rather than dictates answers to such questions. In 25 years, it will offer the prime of analysis is no longer a problem waiting the primary way by which this help is given to companies. The associated computation power in this type of analysis is no longer a problem -what is what is a problem is the ability to analyse weak signals in noisy data It is also about being able to define the right question, after thinking trough the complex, inter-related aspects of peoples responses and technologies in order to find solutions for which business can capitalise tific p and earn money.

sion

The use of science by the year 2020 for the meat industry must be supplying information which gives the industry a much, much, much stronger ologic grash on science by the year 2020 for the meat industry must be supplying information which gives the industry a much, much, much stronger $\log^{10}_{\text{grasp}} = 0$ within \log^{10}_{10} what the consumer needs are. The industry will have in place systems and an analytical capability which can pick up subtle shifts within \log^{10}_{10} with $\log^{$ be within small populations with rapidly changing demographics. This means that systematic methods must be in place and given the size of our mean ind $ave \notin meat industry$ by the year 2020, will be sharing much of this basic information, and sharing much of the analysis over integrated networks. For this e^{ak} $F_{or this}$ to happen there will have to be much closer sharing of information between processing companies, between companies and farmers, between the there will have to be much closer sharing of information between processing companies. That is not to say this pany between companies in the market place and producers / processors and, companies and legislators in various countries. That is not to say this is not of a bight of the market place and producers / processors and, companies and legislators in various countries. That is not to say this is not of the market place and producers / processors and, companies and legislators in various countries. That is not to say this r_{kel} is bot already in place, but by the year 2020 this will occur extensively and in a highly sophisticated manner that is undreamed of now. Who would have been but by the year 2020 this will occur extensively and in a highly sophisticated manner that is undreamed of now. Who p_{0} p_{0} p_{0} w_{0} w_{0

tomo Trade Access

Having access to consumers and having a knowledge of their preferences, of their wants, their needs of a meat product is only part of the story. What access to consumers and having a knowledge of their preferences, of their wants, their needs of a meat product is only part of the story. ucts^{whing} access to consumers and having a knowledge of their preferences, of their wants, their needs of a first product to be the WTO agreement of trade barriers, for it's one thing to say consumers want a product, it's another to get it across the border. Despite the WTO agreement arket agreements agricultural products will probably, continue to be the subject of barriers to trade. Not crude import barriers and quotas based on merit arguments agricultural products will probably, continue to be the subject of barriers to trade. Not crude import barriers and quotas based on science and technology issues, myths, prejudices. You name it - it mer arguments agricultural products will probably, continue to be the subject of barriers to trade. Not crude import any stress of the protection of local industry, but subtle barriers based on science and technology issues, myths, prejudices. You name it - it will be the Will be there, for human beings are human beings and vested interests will occur no matter what international agreements exist. What science will control of human beings are human beings and vested interests will occur no matter what international agreements exist. What science be there, for human beings are human beings and vested interests will occur no matter what international agreements of a scientific contribute to these arguments will be factual rational argument. It can expose unfounded fears and prejudice. Such a scientific contribute to these arguments will be factual rational argument. It can expose unfounded fears and prejudice. Such a scientific contribute to these arguments will be factual rational argument. contribute to these arguments will be factual rational argument. It can expose unrounded the factual really are.

For New Zealand as a primary exporter of natural products, science's role has to be very significant in the establishment of free trade practices. For that reason science will be a Government tool. When I say science, I mean not just scientific information, but scientists will be the tool of Government tool. When I say science, I mean not just scientific information, but scientists will be the tool of the science will be a Government tool. Government for making sure that rational arguments pervades in discussion of subjects of national interest. These will range from introduced pests to have Pests to bacterial contamination, to product deterioration, to environmental effects, of residues, of flavour contamination and a whole host of other problem. the other problems. You name it - you can think of some technical issue which pertains to the meat industry and which could be a technical barrier when if New Zool. whole if New Zealand does not secure sound scientific advice on the issue.

diffe

hyg

The point is that New Zealand has a reputation for clean products and yet in the year 2020 people everywhere will be able to analyse the Composition ^{composition} of products, including contaminants, to a much lower level than is dreamed possible today. Already scientifically you can measure the presence of products, including contaminants, to a much lower level than is dreamed possible today. Already scientifically you can measure the presence of products, including contaminants, to a much lower level than is dreamed possible today. the presence of single molecules and you might have seen in a recent newspaper, the demonstration of a sensor that could pick up the change in level of single molecules and you might have seen in a recent newspaper, the demonstration of a sensor that could pick up the change in level of single molecules and you might have seen in a recent newspaper, the demonstration of a sensor that could pick up the change in level of single molecules and you might have seen in a recent newspaper, the demonstration of a sensor that could pick up the change in level of single molecules and you might have seen in a recent newspaper, the demonstration of a sensor that could pick up the change in level of single molecules and you might have seen in a recent newspaper. ^{Presence} of single molecules and you might have seen in a recent newspaper, the demonstration of a sector involved are so low that most ^{Presence} of sugar in Darling Harbour when a scientist dropped a sugar lump in it. The levels of contaminants become a problem for human consumption. guist people will have difficulty comprehending. The question then is at what level do contaminants become a problem for human consumption. That around That argument is one that has gone on for years but it will continue. It is becoming largely a political question but it is a question where the answer only it is one that has gone on for years but it will continue. It is becoming largely a political question but it is a question where the de answer only lies in scientific reasoning and no amount of wishing that such analytical developments would not occur can stop these developments and no amount of wishing that such analytical developments would not occur can stop these

¹ It is for that reason that most of the major industries, including the meat industry, must develop a common view of the problem areas and ¹ support a support and a deep understanding of the support a common scientific and technological effort in order to build sophisticated analytical capability and a deep understanding of the Various inc

Transporting and Packaging the Product

Having surmounted the problem of getting a product into a new niche market place to meet a consumer whose demands are understood - what about the problem of getting a product into a new niche market place to meet a consumer whose demands are understood - what m_{arkets}. Two things spring immediately to mind. One is simply, how is a product going to be transported - chilled, frozen or ambient. What will be the total spring immediately to mind. There will be since the technologies involved, in the transportation process, the control and management of those products in the distribution chain. There will be since the technologies involved, in the transportation process, the control and management of those products in the distribution chain. There will be since the technologies involved, in the transportation process, the control and management of those products in the distribution chain. There will be significant technological advances driven in particular by environmental concerns. Environmentally friendlier refrigeration systems will be common be common and certainly lower cost ones . In addition, the packaging materials themselves will be technically sophisticated. The vastly

superior understanding of the physical material properties of packaging will be such that packaging will be very sophisticated. Compared today they will be unbelievable. Already there is the emergence of smarter packaging. By smart packaging is meant packaging which region the composition of gases surrounding the product, through a wide range of temperatures and other physical conditions. This packagin also act as a mechanical protective barrier to make sure that they get delivered in good physical shape.

That might also mean that heretical practices might, by 2020, be the norm. Thus if a product may be made in which the atmosph controlled very carefully, is it conceivable to control what happens to specific bacteria which may also be present. Even if all surface be could be eliminated - would you want to? Are there bacteria which could be deliberately introduced for some particular reason? The questions which are highly speculative, but remember that ideas often leap from one product area to another. This has recently been seen area where, investigations into bacteria taken from organisms several million years old have already identified potential sources of antibiotics. Who knows what the world will look like at the bacterial level in 2020.

In terms of bacteria, I for one do not believe that genetically modified bacteria using DNA manipulation techniques will have an externation future. Such bacteria will certainly provide products with characteristics which are beneficial. However the world of science and importantly, social awareness and traditional taboos, will severely control the exploitation of that type of technology. As the population general becomes more technically literate so the awareness of the potential risks inherent in such technologies will increase. Gone are the when a nuclear fission technology was seen as the white knight of our energy problems. What has at last been learnt, is that there is alw plus and a minus in these major technologies and society is only now beginning to recognise that being technically ignorant is a sign social problem. By 2020 this technological awareness will have been achieved across a wide section of society. Therefore the exploitable such technologies will go forward at a slow, considered pace.

differ In summary, packaging materials, like the products that they will contain, will be niche products in their own right. Packaging will also throu had to cease being a commodity business if it is to survive. It will be the production of tailored, clever plastics and other materials which provi respond to an individual product need which will dominate the world of food products in 2020. anima

Processing

mean Moving back down the chain towards processing - what is likely to be seen there? It is here that we will see the biggest physical change way we do business in the meat industry. By 2020, the processing for new niche products will have seen a major shift from the single chain based structure. Individual identification of animals and even individual cuts, will drive processing methods for niche product smaller more flexible chains. A consequence of such a trend will be that the high capital cost involved in the industry and which has recognised so painfully over the last few years, will continue to be an issue. Processing costs are a significant part of the overall price product and smarter processing will be needed to contain the growth of the costs. It is also one of the social and environmental problem So too and if both the skilled workers' health and the environmental health of New Zealand are to be improved, the problems associated w traditional killing chain must be successfully addressed. It is in that area where by 2020, the use of automation supporting a skilled operation, will be the norm, reducing accidents and minimising the contact between the human being and the product. The result will will will be the norm, reducing accidents and minimising the contact between the human being and the product. Overa improvement in overall hygiene that will improve, both the cost structure, the capital structure and the health of skilled people. today.

The technologies are already beginning to emerge. In the area of automation and robotics cleverer robots than companies are currently us origina will be common and already this industry has started down that track. Robots and automation will be applied widely in which cut of people/machine interface will be much more important than it is at the moment. Instead of just pushing a button and watching a robotic a indeed an operation, robots will assist people by amplifying muscle power to do what is today, highly dangerous operations e.g., lifting heavy the risi Those types of technologies will be daily in place. This in turn will give process staff, as well as technical staff a different dimension 10 jobs. This will provide everyone the opportunity to think about what they are doing and why or how they can help cut costs, maintain provide everyone the opportunity to think about what they are doing and why or how they can help cut costs, maintain provide everyone the opportunity to think about what they are doing and why or how they can help cut costs, maintain provide everyone the opportunity to think about what they are doing and why or how they can help cut costs, maintain provide everyone the opportunity to think about what they are doing and why or how they can help cut costs, maintain provide everyone the opportunity to think about what they are doing and why or how they can help cut costs, maintain provide everyone the opportunity to think about what they are doing and why or how they can help cut costs, maintain provide everyone the opportunity to the set of the set o improvement etc. This contribution to the processing operation will come from every level in an organisation so that employees will be produc using both hands and heads.

Around the world a vast amount of science is being carried out on what is called material science. Gone will be the days when man All of basically came out of an iron foundry or an aluminium smelter. Even today highly sophisticated ceramics or metal alloys are available in materials are constructed from a molecular level upwards. The product characteristics which are required, will be available to equil designers. They will define the functions and environment of a new machine and manufacturers will have a range of new sophisticated ma to chose from. This will result in a new technology capability in suppliers and benefit processors through lower cost/higher performance.

In fact one of the hardest known substances, a boron compound, was actually predicted before it had ever been made. A scientist the out and made it and then proved that the hardness was the same as a prediction. In superconductors the molecular layers of atoms complex structure are what gives the superconducting material its unique characteristics. Such an approach to new materials applies cience other ceramics and to half-way houses, ceramic metallic compounds. Thus by 2020 materials will be designed to have certain put possibi characteristics and characteristics which enable them to operate in defined environments. In another example, silicon carbide has been for the last 20-30 years. Silicon carbide has some unique properties but it is only now that it can be made into thin films. These films are the made into the films are the made into the films are the made into the films. for the last 20-30 years. Silicon carbide has some unique properties but it is only now that it can be made into thin films. I nese that hard, and are very difficult to make but it has some highly useful properties, particularly for the semi-conductor business. Equally some up and the application of the semi-conductor business. hard, and are very difficult to make but it has some highly useful properties, particularly for the semi-conductor business. Equally some dofind and metal alloys are now being made for the aerospace industry. Carbon fibre which was originally made for exotic uses, rapidly came dofind structure are and the semi-conductor business. price as the characteristics were appreciated and is now used in quantity in a variety of different industries. The same trend will be seed of uses result of the effort currently underway in material sciences where a major international effort is occurring at the moment. So machines busine very different to those of today - running longer without failure or service and with lower energy consumption. will no

pared Integration with The Farms

The meat industry will also be more integrated. It must not forget that the value to the farmer, to the processor, to the consumer - is in the utilized.

This leads to the inevitable interlinking of organisations through networks, alliances etc. In this area, clairvoyants have trouble picking what the $ce^{be^{1}}$ hext 5-10 years will bring, let alone the next 25.

The set $F_{\text{Barrier}}^{\text{Those}}$ so how will processors and farmers and therefore on farm research help the industry in the year 2020? In many ways this is a paradox. seen by how will processors and farmers and therefore on farm research help the industry in the year 2020? In many ways this is a paradox. Farming at the beginning of this century could be best described as primarily a family way of life rather than a simple profit business. In many countries today it has become driven by economics and become more of a business than a family way of life. As products in 2020 come to serve niche' markets, individual products and animals become individuals once again. By 2020 animals will be identified as arriving at a exter markets, individual products and animals become individuals once again. By 2020 animals will be identified as arriving at a perticular farm, even a particular part of a farm. This will mean that the role and capability of the individual Tarmer to produce a particular type of animal, will once again be of major importance as a whole new behavioural pattern will emerge in the way the Way that farm management is conducted. By the year 2020 a lot more information will be on hand about the inter-relationship between the pulatio that farm management is conducted. By the year 2020 a lot more information will be on hand about the wider environment, farm that active in the second secon re the is all the interaction with the weather and the wider environment, failing and the interaction with the weather and the wider environment, failing and the interaction with the weather and the wider environment, failing and the interaction with the weather and the wider environment, failing and the interaction with the weather and the wider environment, failing and the interaction with the weather and the wider environment, failing and the interaction with the weather and the wider environment, failing and the interaction with the weather and the wider environment, failing and the interaction with the weather and the wider environment, failing and the interaction with the weather and the wider environment, failing and the interaction with the weather and the wider environment, failing and the interaction with the weather and the wider environment, failing and the interaction with the weather and the interaction with the weather and the wider environment, failing and the interaction with the weather and s and the individual animals for particular genetic characteristics which are related to the product required. In this case, by genetic characteristics I from the mean and the product quality. To answer questions of sign hean an animal s for particular genetic characteristics which are related to the product required. In this case, of genetic data of the second s Processors and consumers alike. Therefore for example, smaller, more specialised flocks of sheep could be the norm. This will create a there and consumers alike. Therefore for example, smaller, more specialised nocks of sheep could be used environment. Thus there are a set of management issues, ones of maintaining and exploiting characteristics based on genetics and the local environment. Thus there are a set of management issues, ones of maintaining and exploiting characteristics based on genetics and the local environment. Thus there are a set of management issues, ones of maintaining and exploiting characteristics based on genetics which aid the processor, also through sophisticated selection of animals, farmers will be ensuring that animals have certain physical characteristics which aid the processor, which sophisticated selection of animals, farmers will be ensuring that animals have certain physical characteristics which aid the processor, which are the provider of the provider of the processor. ^{rega} sophisticated selection of animals, farmers will be ensuring that animals have certain physical characteristics where the smallest ^{provide} disease resistance, tenderness improvements, etc. The issue therefore will not just be a question of the heaviest animal, or the smallest ^{animal} and disease resistance, tenderness improvements, etc. The issue inererore win not just be a question of the neutron acceptance in niche and or the middle weight animal, but what are the characteristics required for efficient processing and consumer acceptance in niche market. Markets. What's more, by understanding the genetic characteristics and the response to the environment, farmers will be able to respond directly. What's more, by understanding the genetic characteristics and the response to the environment, terms what the individual farmer and processor to the market signals, through the processors, in terms which provide much greater flexibility. What that actually be the market signals, through the processors in terms which provide much greater flexibility. What that actually means is that a farmer's risk, and processor's risk, be more integrated as a total business yet leaving the individual farmer and processor to hanage their type of business to best advantage. ingle

The industry was determined by the seeks to maintain its place in the global meat industry in the seeks to be s to the second se heat heat providers. We recognise that New Zealand is only a small country, and by ensuring a primary focus for our industry and resources, physical providers. We recognise that New Zealand is only a small country, and by ensuring a primary focus for our industry and resources, physical providers and technology advances which are taking place right now, let alone in 20 years from now, will open up all sorts of opportunities and possibility.

are the meat industries strength in the future, will depend on how well the need and use of science and technology is understood and how they applied applied to applied the prooccupation with how a farmer or a producer gets paid. The do house at every step in the chain from consumer to farm. Gone will be the preoccupation with how a farmer or a producer gets paid. The dol industry will be one vertically integrated virtual operation. There will be many discreet entities but without this new way of integrating among seed at of the operation. There will be many discreet entities but without this new way of integrating among and the operation. $set u_{0}$ strong science underpinning they will be one vertically integrated virtual operation. There will be many discreet entities but without this new way of integrating set u_{0} strong science underpinning they will be fewer countries in the international meat u_{0} we will not maintain a viable industry does not have a strong science underpinning they will be in the hobby farming business, they business. For the countries whose meat industry line a strong science underpinning they will be in the hobby farming business, they have a strong science that the New Zealand meat industry faces. ^{ACSS.} For the countries whose meat industry does not have a strong science underprinting they will be in a real profitable business of national importance. That is the challenge that the New Zealand meat industry faces.

Finally, it will be interesting to look in 2020 and see how much of this look into the future will have come to pass.
